

Supplementary Figure 1: Principal component analysis of the dataset variation. The first two axes explained 56.4% of total variation. Each point corresponds to an adult *Ae. aegypti* female, colored according to mosquito strain: green = *Wolbachia*-uninfected; red = wAlbB; blue = wMel.

Supplementary Figure 2: Full model path diagrams for: (A) *Wolbachia*-uninfected field population, (B) *wMel*, and (C) *wAlbB*. Numbers over the arrows are the path coefficients and their statistical significance is indicated as follows: * $P < 0.05$, ** $P < 0.01$.
