

Supplementary Figure

**Figure S1. Flow cytometric analysis after addition of whole blood to ICG-labeled platelets (10 μM ICG final concentration in 100% PAS-E).** In 100% PAS-E leakage of ICG from labeled platelets was not observed resulting in sufficient differentiation between labeled platelets from platelet concentrates and non-labeled platelets from whole blood. Labeling platelets in plasma containing additive solution leakage generated insufficient labeling with subsequent leakage of ICG from labeled platelets.
