

Supplemental Figure 1. Most aqueous-enriched chemokines are also elevated in active disease. uveitis. Comparisons of 31 aqueous fluid proteins in samples from patients without history of uveitis (n=3), from the quiescent phase of uveitis without active inflammation (n=17), and uveitis patients with active disease (n=26). We assessed for statistically significant differences between groups using Kruskal-Wallis tests with Dunn's multiple comparisons test. Statistical significance is indicated as follows: \*, p<0.05; \*\*, p<0.01; \*\*\*, p<0.001; and \*\*\*\*, p<0.0001.
