

Supplementary Figure S1. Analysis of Ki67+ CD8 T cells in peripheral blood. The percentage of Ki67+ CD8 T cells in peripheral blood was assessed at the indicated times in patients with MF-MR (n=3) and SM (n=6). Error bars indicate standard deviations. Comparison of Ki67+ CD8 T cells at week 1, and the change in Ki67+ CD8 T cells between week 1 and baseline, for patients with MF-MR and SM were not significant ($P > 0.05$). Statistical significance was assessed by a two-sided t-test.
