

Fig S1. Impact of the phenolic compounds and FAK14 on bacterial viability.

Bacteria were inoculated into 24-well plates containing complete RPMI medium \pm the indicated drugs or DMSO (carrier alone), as described for the cell association and invasion assays but without host cells present. After 2-h incubations in a humidified CO₂ incubator at 37°C, bacterial titers were enumerated by plating serial dilutions. Bars indicate mean values from 3 independent assays (with SD).
