

## Supporting Information

Table S1. Experimental design and schedule for Experiment 1. The experiment ran for a total of two weeks. In Experiment 1, there were two treatments: visual access to conspecifics ("visual") and pebble pictures under the tank ("pebbles") provided in one half of the tank. F signifies that enrichment was provided at the front half of the tank; B signifies that enrichment was provided at the back half of the tank. Front and back positions of each treatment were switched on Wednesdays. Treatments are highlighted with different colors. No treatments were applied during the weekend and all fish had visual access to neighboring conspecifics at this time.

Rack	Tank	# Fish	Mon	Tues	Wed AM	Wed PM	Thu	Fri	Sat/Sun	Mon	Tues	Wed AM	Wed PM	Thu	Fri

Table S2. Experimental design and schedule for Experiment 2. The experiment ran for one week. Treatments (barren tanks or tanks with pebbles under the entirety of the tank bottom) are highlighted with different colors. All fish had visual access to conspecifics during this experiment, and only one treatment was provided to each tank.

Rack	Tank	# Fish	Mon	Tues	Wed	Thu	Fri	Sat	Sun	Mon
