

## *Supplementary Information*

**Supplementary Table 1** Detailed information on the field identification and codes for participants included in the United Kingdom Biobank. ICD-10, the International Classification of Diseases, 10th Revisions; ICD-9, the International Classification of Diseases, 9th Revision.

**Supplementary Table 2** The International Classification of Diseases (ICD) codes and self-reported codes for excluded diseases.

**Supplementary Table 3** The prevalence of fracture in male, female and pooled samples with or without major depressive disorder (MDD) and the prevalence of MDD in male, female and pooled samples with or without fracture.

**Supplementary Table 4** The prevalence of fracture in different age groups with or without major depressive disorder (MDD) and the prevalence of MDD in different age groups with or without fracture.

**Supplementary Table 5** The information of 74 lead single nucleotide polymorphisms (SNPs) for major depressive disorder (MDD) with the risk of fracture.

**Supplementary Table 6** Baseline characteristics of participants and comparison between individuals with and without major depressive disorder (MDD) and fracture. BMD, bone mineral density; BMI, body mass index.

**Supplementary Table 7** The results of genetic correlation and cross-trait analysis between major depressive disorder (MDD) and fracture.  $rg$  = genetic correlation,  $se$  = standard error of  $rg$ ,  $P$  value = p-value for  $rg$ ,  $gcov\_int$ ,  $gcov\_int\_se$  = cross-trait LD Score regression intercept and standard error.  $nc1@p9$ ,  $nc2@p9$ , and  $nc12@p9$  = the number of causal variants for trait1, trait2 and both, respectively;  $nc@p9$  = number of trait-influencing variants specific to MDD;  $\rho\_beta$  = the correlation of effect sizes within the shared polygenic component;  $rg$  = genetic correlation;  $concordant\_fraction$  = the proportion of shared variants with concordant direction of effect in both traits on all shared variants;  $\pi1$ ,  $\pi2$ , and  $\pi12$  = polygenicity of trait1, trait2 and both, respectively.

**Supplementary Table 8** Distinct genomic loci shared between major depressive disorder (MDD) and fracture at conjunctive false discovery rate (conjFDR)  $< 0.05$ .

**Supplementary Table 9** The results of Summary-data-based Mendelian Randomization (SMR) analyses for the expression of *SGIP1* (ENSG00000118473)

with major depressive disorder (MDD) and fracture in spinal cord (cervical) and muscle (gastrocnemius).

**Supplementary Table 10** The general biological functions of 53 genes.

**Supplementary Fig.1** The matching information of 39 965 patients with fracture.

**Supplementary Fig.2** The prevalence rate in different age groups. Panel A: the prevalence rate for fracture with or without major depressive disorder (MDD). Panel B: the prevalence rate for MDD with or without fracture.

**Supplementary Fig.3** The association of genetically predicted major depressive disorder (MDD) with fracture and vice versa in male and female.

**Supplementary Fig.4** The annotation of genetic associations with Functional mapping and annotation (FUMA). Panel A: the result of genome-wide association study (GWAS) catalog reported genes. Panel B: Multi-marker Analysis of GenoMic Annotation (MAGMA) tissue expression analysis results. Per-tissue enrichment of expression of genes based on Genotype-Tissue Expression (GTEx) RNA-seq data for left 30 general and right 54 specific tissue types.

**Supplementary Fig.5** A simple illustration of the assumptive mechanism: the potential implication of the *SGIP1* gene in the pathology of major depressive disorder (MDD) and fracture.

**Supplementary Table 1** Detailed information on the field identification and codes for participants included in UK Biobank.

**Supplementary Fig.1** The matching information of 39 965 patients with fracture.

**Supplementary Fig.2** The prevalence rate in different age groups. Panel A: the prevalence rate for fracture with or without major depressive disorder (MDD). Panel B: the prevalence rate for MDD with or without fracture.

**Supplementary Fig.3** The association of genetically predicted major depressive disorder (MDD) with fracture and vice versa in male and female.

**Supplementary Fig.5** A simple illustration of the assumptive mechanism: the potential implication of the *SGIP1* gene in the pathology of major depressive disorder (MDD) and fracture.
