**Immunometabolic adaptation in monocytes
underpins functional changes during pregnancy**

April Rees, Benjamin J. Jenkins, Roberto Angelini, Luke C. Davies, James G. Cronin, Nicholas Jones, and Catherine A. Thornton

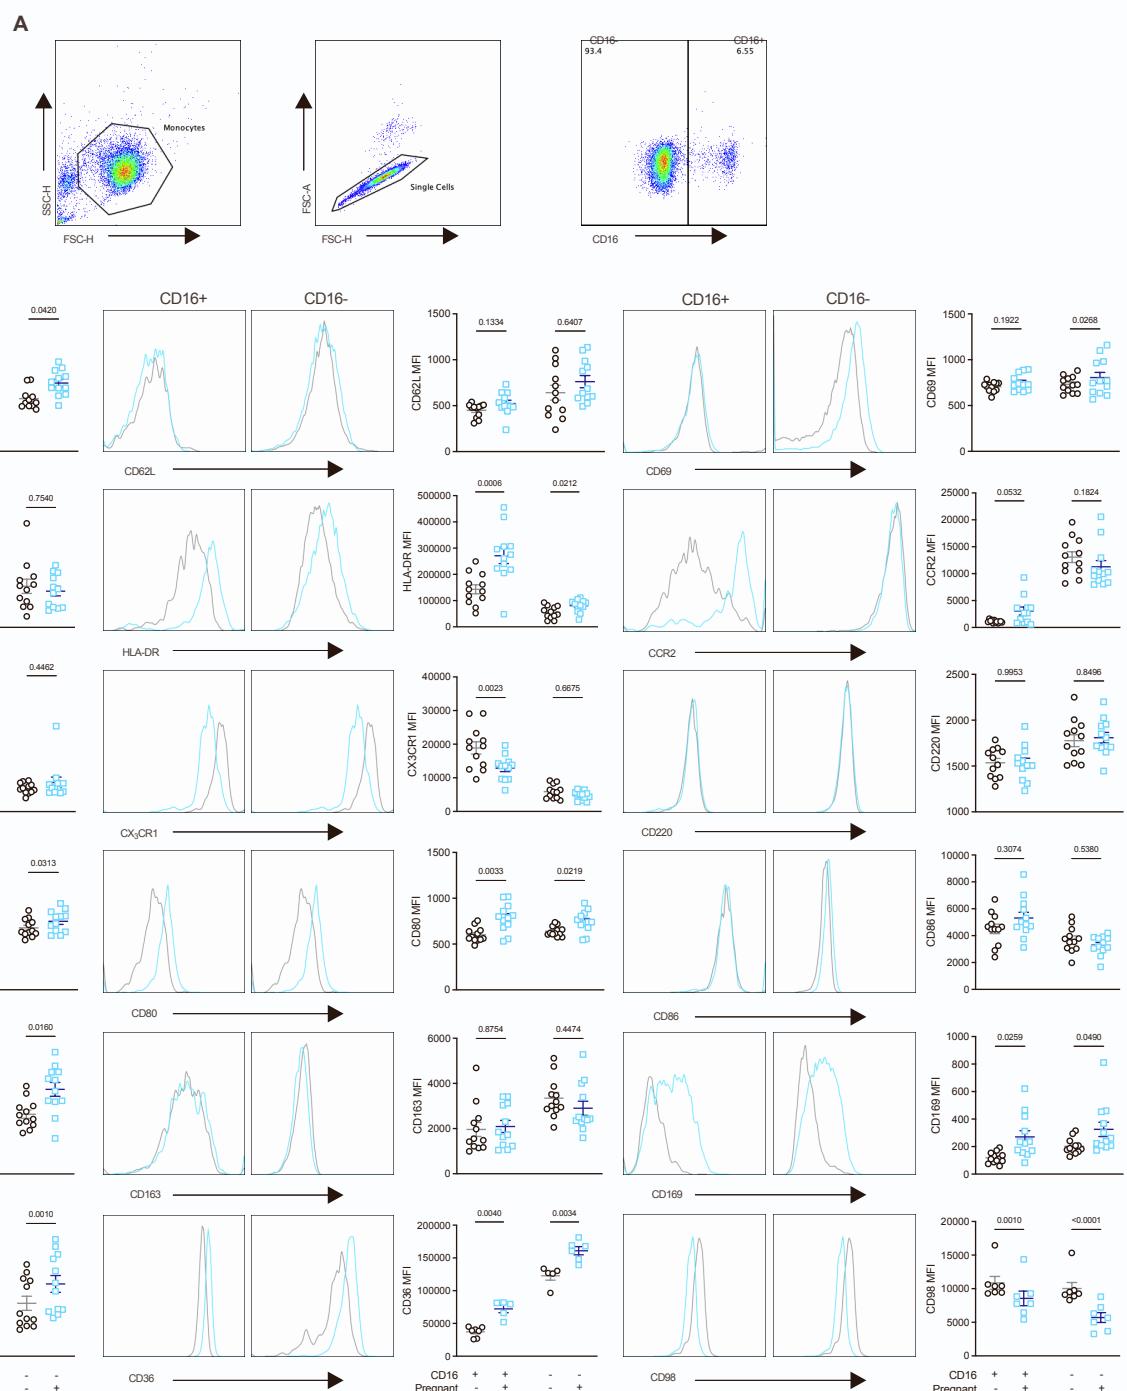

Figure S1. Relating to Figure 1, representative dot plots and histograms for flow cytometry phenotyping. (A) Dot plots illustrating the gating strategy for isolated monocytes to determine the phenotype of CD16+ and CD16- subsets. (B) Histograms and individual graphs for each expression marker analysed for CD16+ and CD16- subsets from non-pregnant (grey) and pregnant (blue) monocytes.

Figure S2. Relating to Figure 1, Functional consequences of the changes in CD36 and CD98. (A) Monocytes from non-pregnant (grey) and pregnant (blue) donors were subjected to LipidTOX™, BODIPY 493 (both storage), and BODIPY 500 (uptake), and analysed on the flow cytometer. (B) Representative histograms for the appropriate controls for analysis of kynurene uptake. Monocytes were analysed for their ability to take kynurene up from non-pregnant (grey) and pregnant (blue) donors.

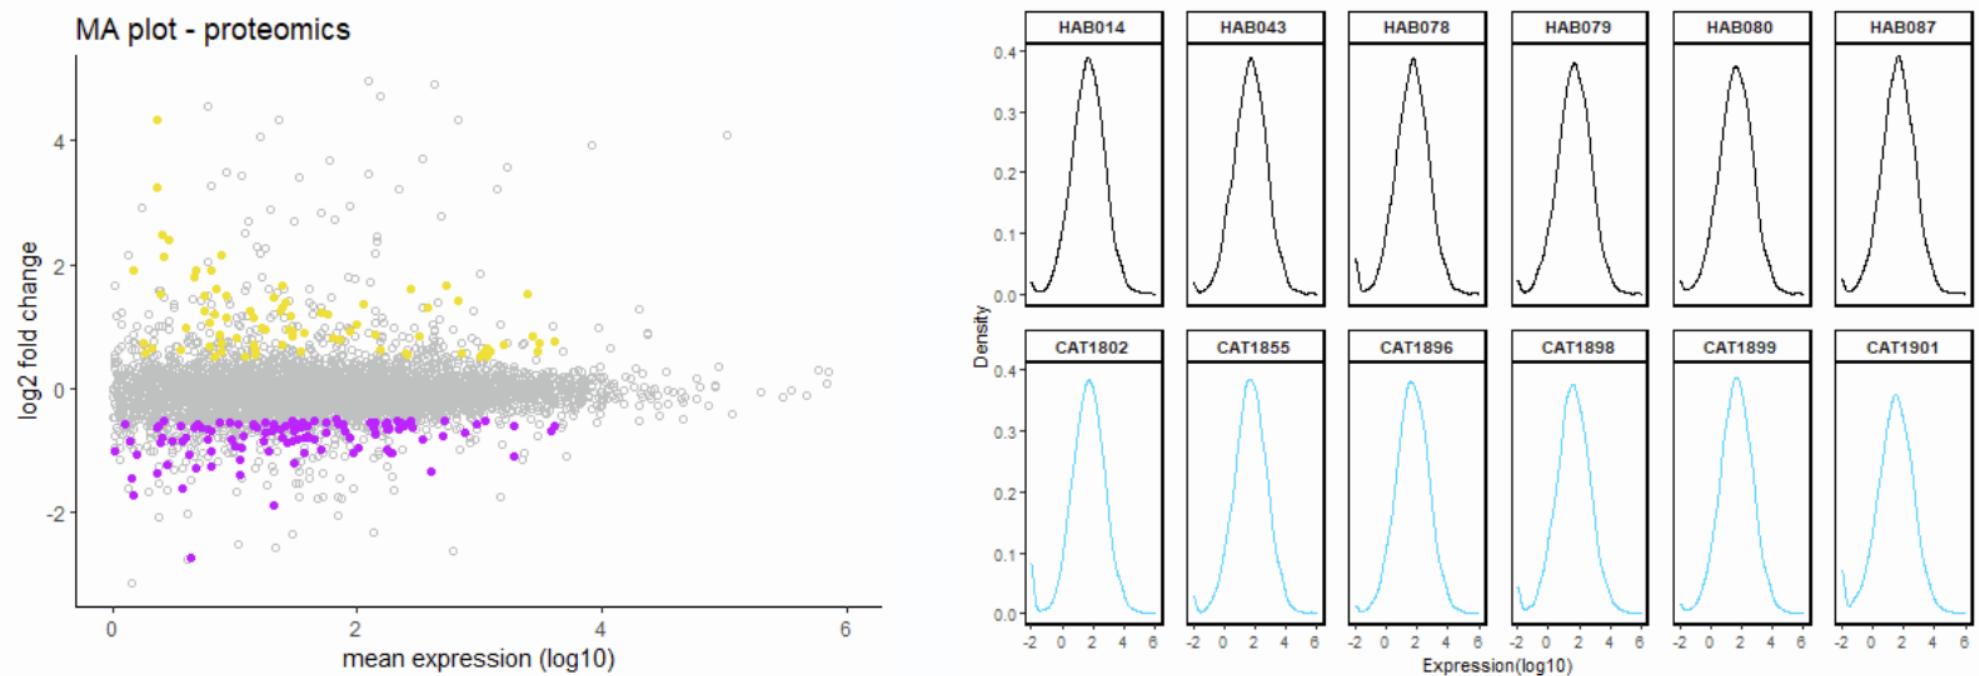

Figure S3. Relating to Figure 1, QC checks for proteomics. An MA plot for the proteomics data showing proteins which were found to be significantly up-regulated in pregnancy in gold, and down-regulated in purple. Distribution plots of the proteins found for each donor are also illustrated, highlighting the consistency between the groups.

Figure S4. Relating to Figure 1 and Figure 2, STAT1 mRNA and protein, and LBP levels in serum from non-pregnant and pregnant females. (A) STAT1 mRNA data taken from the NanoString ^(C) Metabolism panel, and protein data taken from proteomics. (B) LBP levels in serum (n=14/group) were measured using an LBP-specific ELISA. Statistical analysis was performed using a Mann-Whitney test where $p < 0.05$ was considered significant.
