This supplementary material includes five Online Resources: (1) a flow chart showing the exclusions made in each cohort used in this study, (2) a table of foods included within each food group used in the substitution analyses, (3) the formula for a leave-one-out model used to model partial substitutions of red or processed meat with plant-based foods in relation to CRC risk, (4) a table of associations between the substitution variables and colorectal cancer risk continuously and per 100 g/week or 50 g/week (processed meat) consumption, and (5) a table of associations between partial substitutions of red or processed meat with plant-based foods and CRC risk displayed separately for ATBC and the remaining cohorts.

Online Resource 1 Exclusions and final study samples by cohort

ATBC, the Alpha-Tocopherol, Beta-Carotene Cancer Prevention Study; Health 2000, the Health 2000 Health Examination Survey; HBCS, the Helsinki Birth Cohort Study; DILGOM 2007, the Dietary, Lifestyle and Genetic Determinants of Obesity and Metabolic Syndrome 2007 Study; FINRISK 2012, the National FINRISK 2012 Study; FFQ, food frequency questionnaire

^aIncomplete questionnaire with several empty food item rows (exclusions made case by case)

^bEnergy intake <1000 or >5000 kcal/d

^cDue to differences in data gathering and reporting, in ATBC, the number of participants excluded for missing or inadequately filled FFQ or implausible energy intake are presented together.

^dHistory of cancer other than non-melanoma skin cancer

^eIndividuals with a cancer history (other than non-melanoma skin cancer) were excluded in recruiting participants for the trial.

^fHealth 2000: energy intake <600 or >7000 kcal/d; HBCS, DILGOM 2007 and FINRISK 2012: 0.5% sex-specific extremes in energy intake distribution

Online Resource 2 Foods included in each food group used in the substitution analyses

Food group ^a	Included foods
Red meat	Beef, pork and lamb (e.g., minced meet, beef steak)
Processed meat	Sausages (e.g., fresh sausages, frankfurters, bratwurst) and cold cuts (e.g., smoked ham, meat cuts, meat sausages) ^b
Whole grains	Rye, oat and barley (e.g., rye flour, rolled oats) ^c
Vegetables	Cabbages, leaf vegetables, nuts and seeds ^d , mushrooms, onions, root vegetables ^e and vegetable fruits
Fruits	Fruits (e.g., citrus fruits, apples) and berries (e.g., strawberry, blueberry)
Legumes	Beans, green peas, green beans and soya

^aThe food groups were defined based on the food classifications of the Finnish Food Composition Database Fineli® (31).

^bIncluding processed meat made of beef, pork and lamb

^cRye, oat and barley combined has been shown to correspond well (r=0.99) to total whole grain intake among Finnish adults (32).

^dConsumption of nuts and seeds is and has been very low in Finland, for which they were not considered as their own food group but included in vegetables.

^eExcluding potatoes

Online Resource 3 The leave-one-out model for studying a partial substitution of red or processed meat with plant-based foods in relation to colorectal cancer (CRC) risk

Model expression ^a	Variables
$f(Y) = \alpha_1 A + \alpha_2(A + B) + \text{confounders}$	<p>$\alpha_1 A$ = beta coefficient^{b,c} for the substitution variable (whole grains, vegetables, fruits, or a combination of these) by 100 g/week or 50 g/week consumption</p> <p>$\alpha_2(A + B)$ = beta coefficient^b for the sum variable constructed of the substitution variable and the food that is being substituted (red meat or processed meat) by total consumption</p>

^aModified from Song & Giovannucci 2018 (36)

^bBeta coefficients are calculated by Cox proportional hazards multivariate models.

^cParameter for the substitution effect. Beta coefficient for A (α_1) is exponentiated to calculate the hazard ratio (HR).

Online Resource 4 Pooled associations between consumption of the substitution variables (quintiles and 100 g/week or 50 g/week) and colorectal cancer risk (hazard ratios [HR] and 95% confidence intervals [CI])

	Quintile 1	Quintile 3	Quintile 5	P_{trend}	P_{het}^a	100 g/week ^b	P

IQR, interquartile range

^a*P* for heterogeneity between the pooled cohorts was tested by Q-statistics (model 2).

^b50 g/week for processed meat

^cModel 1 was adjusted for sex, age (years, continuous) and energy intake (kJ/day, continuous).

^dModel 2 was adjusted for variables in model 1^c + educational attainment (low, middle, high), smoking habits (never, former, current), height (m, continuous), body mass index (kg/m², continuous), leisure-time physical activity (inactive, somewhat active, active), hormone replacement therapy use (in women; never, ever), and consumption of alcohol (100%; g/day, continuous) and dairy products (g/day, continuous)

^eWhole grain intake was assessed based on the combined consumption of rye, oat and barley (32).

^fVegetables excluding legumes and potatoes and including nuts and seeds

Online Resource 5 Associations between partial substitutions of red meat or processed meat with whole grains, vegetables, fruits or a combination of these and colorectal cancer risk in ATBC and the remaining cohorts (hazard ratios [HR] and 95% confidence intervals [CI])
