Supplementary Methods

Strain construction of VNP20009 Δ*invA:sfgfp*

1 *invA* knockout replacement repair homology arm construction

1.1 Homology arm fragment and *sfgfp* gene amplification

The upstream and downstream homology arm sequences of *invA* were amplified using VNP20009 DNA as template with primers invA-19-F, invA-sfgfp-R, invA-sfgfp-F and invA-19-R. Amplification of *sfgfp* fragments with primers sfgfp-invA-F/R, using the *sfgfp* plasmid as a template (Supplementary Fig. 29).

Amplification system:

2×pfu PCR mix	25μl
Primer P1(10μM)	2μl
Primer P2(10μM)	2μl
Template	2μl
ddH_2O	19μl
Total	50μl

Amplification condition: 94°C 5min 30Cycle (94°C 30sec, 55°C 30sec, 72°C 40sec)

1.2 Seamless cloning

The three amplified fragments were seamlessly cloned according to the following system.

5×infusion cloing mix	2μl
Up-Recycled fragments	2μl
Sfgfp-Recycled fragments	2μl
Down-Recycled fragments	2μl
puc19[*Eco*RI-*Hin*dIII] linear carrier	2μl
Total	10μl

After mixing, leave on ice for 30min, transform *E. coli* DH5α competent cells, spread Amp/IPTG/x-gal plate, and incubate at 37°C to pick the white fluorescent clone for sequencing. The sequenced clone was named invA(up-sfgfp-down)-puc19.

1.3 Repair homology arm amplification

The correctly sequenced invA(up-sfgfp-down)-puc19 plasmid was used as a template with primers invA-up-F/invA-down-R. The primers were used to amplify the repaired homology arm of the *invA* knockout substitution according to the following system.

2×superpfu PCR mix	25μl
invA-up-F(10μM)	2μl
invA-down-R(10μM)	2μl
invA(up-sfgfp-down)-puc19	1μl
ddH_2O	20μl
Total	50μl

Amplification conditions: 94°C 5min 32Cycle (94°C 30sec, 55°C 30sec, 68°C 40sec) 10°C hold on

2 CRISPR/Cas9 *invA* knockout replacement strain screening

2.1 Preparation of VNP20009 competent cells

1) Activated culture of VNP20009 at 37°C;
2) Inoculate the monoclonal to 5ml LB liquid medium;
3) The next day it was transferred to 50 ml LB liquid medium and centrifuged to collect the bacteria at an OD growth rate of about 0.8;
4) The bacteria were washed three times with 10% glycerol and finally resuspended with 2ml 10% glycerol as the prepared competent cells.

2.2 Electrotransformation of plasmids containing pCas9

Add 10μl of plasmid to the prepared competent cells and place them on ice for 5min, electrotransform them at 2500V, add 1ml of LB medium, and incubate them at 37℃ for 1h before spreading the Kan-resistant plate.

2.3 Transformation of sgRNA and repair of homology arms

Recovered *invA-sfgfp* repair homology arm and prepared sgRNA plasmid were electrotransformed into prepared Cas9 VNP20009 competent cells, and Kan/Tc plates were coated to screen for integrating strains.

2.4 Gene identification of VNP20009 Δ*invA:sfgfp*

The primers invA-up-F/invA-down-R and invA-ter-F/R were used to identify wild bacteria and integrating bacteria (Supplementary Fig. 30). After identification, the tool plasmid was eliminated to obtain VNP20009 Δ*invA:sfgfp*. The editing bacteria containing Cas9 plasmid were also saved for use in the next editing step.

Strain construction of VNP20009 Δ*invA:sfgfp glms:FNR-invA*

1 *FNR-invA* insertion repair homology arm construction

1.1 Amplification of insertion site homology arms and insertion gene fragments

The upstream and downstream homology arms of *glms* were amplified with primers glms-19-F/glms-FNR-R and glms down-invA-F/glms-19-R, respectively, using VNP20009 DNA as a template. The *FNR* promoter sequence was amplified using the *FNR* promoter vector, and the *invA* gene fragment for insertion was amplified using invA-FNR-F/invA-his-R (Supplementary Fig. 31).

Amplification system:

2×pfu PCR mix	25μl
Primer P1(10μM)	2μl
Primer P2(10μM)	2μl
Template	2μl
ddH_2O	19μl
Total	50μl

Amplification conditions: 94°C 5min 30Cycle (94°C 30sec, 55°C 30sec, 72°C 40sec) 10°C hold on

1.2 Seamless clonal joining of homologous arm fragments and insertion genes

The amplified fragments were purified from PCR products and then seamlessly clonally ligated according to the following system conditions.

5×infusion cloing mix	2μl
Up-Recycled fragments	2μl
invA-Recycled fragments	2μl
FNR-Recycled fragments	1μl
down-Recycled fragments	2μl
puc19[*Eco*RI-*Hin*dIII] linear carrier	1μl
Total	10μl

After mixing and placing on ice for 30 min, *E. coli* DH5α competent cells were transformed and cultured on Amp/IPTG/x-gal coated plates, followed by picking white single clones for sequencing. The correctly sequenced clone was named glms-Up-FNR-invA-down-pUC19.

1.3 Preparation of repair homology arms for *FNR-invA* insertion

Repair of homology arm fragments by amplification with primers glms-up-F/glms-down-R using the correctly sequenced glms-Up-FNR-invA-down-pUC19 plasmid as a template.

2 CRISPR/Cas9 *invA* insertion strain screening

2.1 Preparation of VNP20009 Δ*invA:sfgfp* pCas9 competent cells as described above.

2.2 Transformation of sgRNA and repair of homology arms

Recovered *glms-FNR-invA* repair homology arm and prepared glms sgRNA plasmid were added to prepared VNP20009 Δ*invA: sfgfp* pCas9 competent cells, placed on ice for 5 min, transformed by 2500V. The integrated strains were screened using coated Kan/Tc plates after adding 1 ml of LB medium and shaking the culture for 1h.

2.3 Gene identification of VNP20009 Δ*invA:sfgfp glms:FNR-invA*

The primers glms-up-F/glms-down-R were used to identify wild bacteria and integrating bacteria (Supplementary Fig. 32). After identification, the tool plasmid was eliminated to obtain VNP20009 Δ*invA:sfgfp glms:FNR-invA*.

Construction of *LysE* gene expression vector and transformation screening

1 Seamless cloning

The *LysE* fragment amplification product and the pBAD plasmid linearisation digest product were seamlessly clonally ligated according to the following system conditions.

5×infusion cloing mix	2μl
LysE Recycled fragments	6μl
pBAD *Eco*RI digested vector fragments	2μl
Total	10μl

After mixing and placing on ice for 30 min, *E. coli* DH5α competent cells were transformed and incubated on Amp plates at 37°C to pick monoclonal identification.

2 PCR identification

Pick the monoclonal to 10 μl of aseptic water and mix well, then take 0.5 μl as a template, according to the following system for identification. Then positive clonal plasmids were picked and sent for sequencing, and the correctly sequenced plasmid was named *pBAD-LysE*.

2×Taq PCR mix	10μl
pBAD-F(10μM)	0.5μl
pBAD-R(10μM)	0.5μl
bacterial solution	0.5μl
ddH_2O	8.5μl
Total	20μl

Amplification conditions: 94°C 5min 30Cycle (94°C 30sec, 55°C 30sec, 72°C 1min) 10°C hold on.

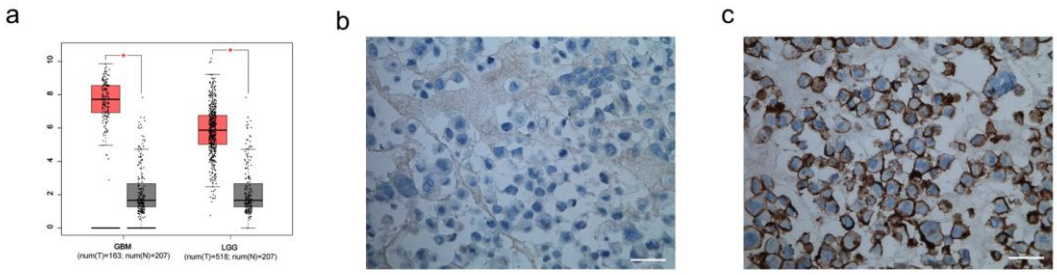
3 Electrotransformation of *pBAD-LysE*

Preparation of VNP20009 Δ*invA:sfgfp glms:FNR-invA* competent cells as described above. Take 1μl of plasmid and add it to the prepared competent cells and place it on ice for 5min, electrotransform it at 2500V, add 1ml of LB medium, recover the culture at 37°C for 1h and then spread the Amp resistance plate.

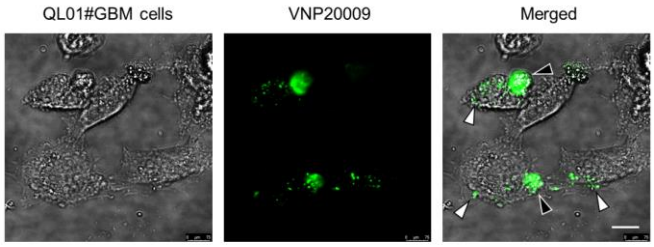
4 Gene identification of VNP20009 Δ*invA:sfgfp glms:FNR-invA pBAD-LysE*

The primers pBAD-F/pBAD-R were used to identify wild bacteria and integrating bacteria. Positive clones were sent for sequencing and the final positive clone identified was VNP20009 Δ*invA:sfgfp glms:FNR-invA pBAD-LysE* (Supplementary Fig. 33).

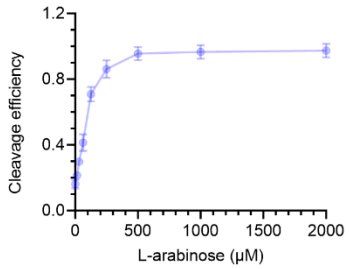
The primer sequences involved above are shown in Supplementary Table 3.



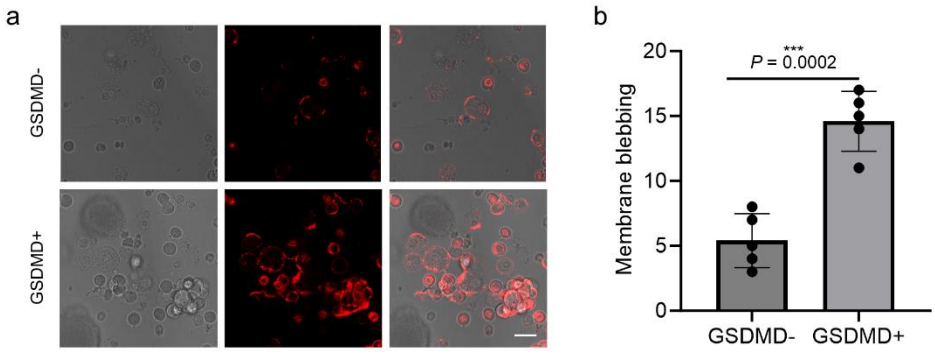
Supplementary Figure 1. (a) mRNA expression levels of CD44 in GBM and low-grade glioma (LGG) analyzed by GEPIA database. The statistical comparisons were performed with the one-way analysis of variance (ANOVA) with Tukey's post hoc test. (b) Immunohistochemical staining showing the expression levels of CD44 in NHA cells. ($n = 3$ independent experiments). (c) Immunohistochemical staining showing the expression levels of CD44 in QL01# GBM cells. ($n = 3$ independent experiments). The scale bar is 10 μm.



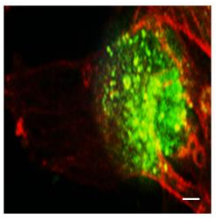
Supplementary Figure 2. Formation of SCVs (black arrows) inside GBM cells after SDV invasion. ($n = 3$ independent experiments). The scale bar is 10 μm.



Supplementary Figure 3. Efficiency curves demonstrating SDV cleavage at various L-arabinose concentrations. ($n = 6$ independent experiments). Data are presented as the mean ± S.D. Source data are provided as a Source Data file.



Supplementary Figure 4. Fluorescence staining (a) and statistical analysis (b) of cell membrane vacuole formation in GSDMD high versus low expressing QL01#GBM cells. ($n = 5$ independent experiments). The scale bar is 10 μm. The statistical comparisons in (b) were performed with two-tailed, unpaired Student's *t* tests, with asterisks indicating significant differences. Source data are provided as a Source Data file.



Supplementary Figure 5. Formation of SCVs after IASNDS treatment in QL01#GBM cells. ($n = 3$ independent experiments). The scale bar is 1 μm.

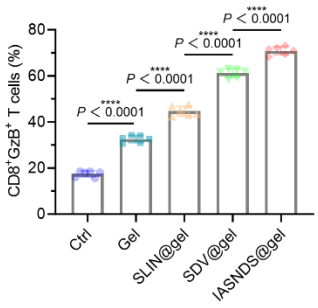
Supplementary Figure 19. Gating strategy for T-cell analysis. On day 20 post-treatment, groups of mice were humanely euthanized. Brain tissue samples were carefully collected and processed into cell suspensions using a glass grinder. Following the subsequent centrifugation and filtration steps, individual cells were quantified for flow cytometry analysis of T lymphocytes. A total of 1,000,000 cellular events was acquired for each sample during the analysis. Relevant cells were identified based on their locations within the FSC/SSC plot, which took into account their size. The total number of T cells was then determined by focusing on $CD3^+$ cell counts. Furthermore, within the population of $CD3^+$ T lymphocytes, a subset consisting of $CD4^+$ and $CD8^+$ T cells was carefully identified, as shown in Figure 7b. In the final step, a thorough analysis was conducted to identify granzyme B-positive T lymphocytes within the $CD8^+$ T lymphocytes, as shown in Figure 7e.



Supplementary Figure 20. Statistical analysis of $CD3^+CD8^+$Granzyme B^+ T cells in GBM tissues under various treatment conditions. ($n = 6$ independent experiments). Data are presented as the mean ± S.D. Statistical comparisons were performed using one-way ANOVA with Tukey's post hoc test, with asterisks indicating significant differences. (exact P values: Ctrl vs. Gel $P = 6.32E\text{-}13$, Gel vs. SLIN@gel $P = 8.0463E\text{-}11$, SLIN@gel vs. SDV@gel $P = 1.14E\text{-}13$, SDV@gel vs. IASNDS@gel $P = 7.48308E\text{-}09$); ****$P < 0.0001$.
