

Supplementary Materials.

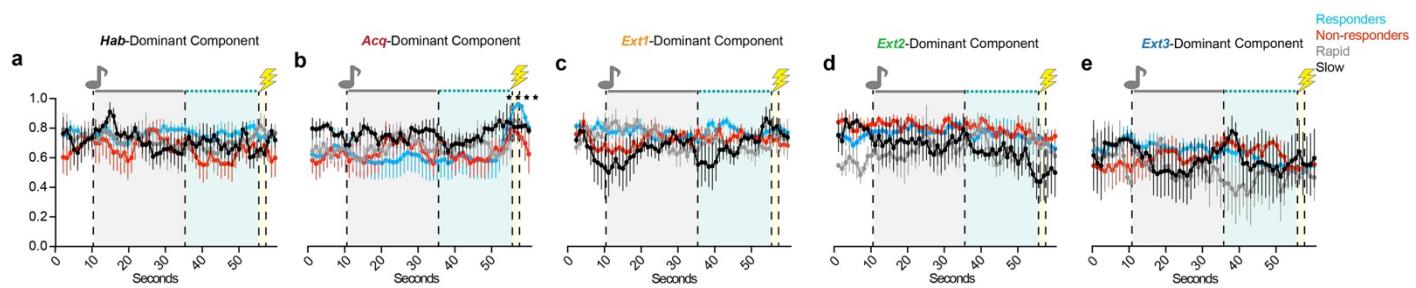

Supplementary Figure 1 | Effects of psilocybin on trace fear extinction in males and females.

a. Trial by trial freezing of saline- and psilocybin-administered mice. Two-Way RM ANOVA with Sidak multiple comparisons correction. (Supp. Table 1, rows 102-106) **b.** Half-session freezing by sex of saline-administered animals. Two-Way RM ANOVA with Sidak multiple comparisons correction. (Supp. Table 1, row 107) **c.** Same as B) in psilocybin-administered animals. Two-Way RM ANOVA with Sidak multiple comparisons correction. (Supp. Table 1, row 108) **d.** Half-session freezing by treatment of excluded animals. Two-Way RM ANOVA with Sidak multiple comparisons correction. (Supp. Table 1, row 109) **e.** Percent freezing during the baseline vs. trace period during Extinction 1. Two-Way RM ANOVA with Sidak multiple comparisons correction. (Supp. Table 1, row 110) **f.** Percent trace-period freezing in early and late periods during an Extinction session 1 month after Extinction 3. Two-Way RM ANOVA with Sidak multiple comparisons correction. (Supp. Table 1, row 111) **g.** ROC curves from logistic regression predicting RE or SE status based on % time freezing during the first half of Extinction 1 during acute drug treatment in saline-administered mice (left) and psilocybin administered mice (right). Right: ROC curve from logistic regression. (Supp. Table 1, rows 12, 14) * p ≤ 0.05, ** p < 0.01, *** p < 0.001, **** p < 0.0001.

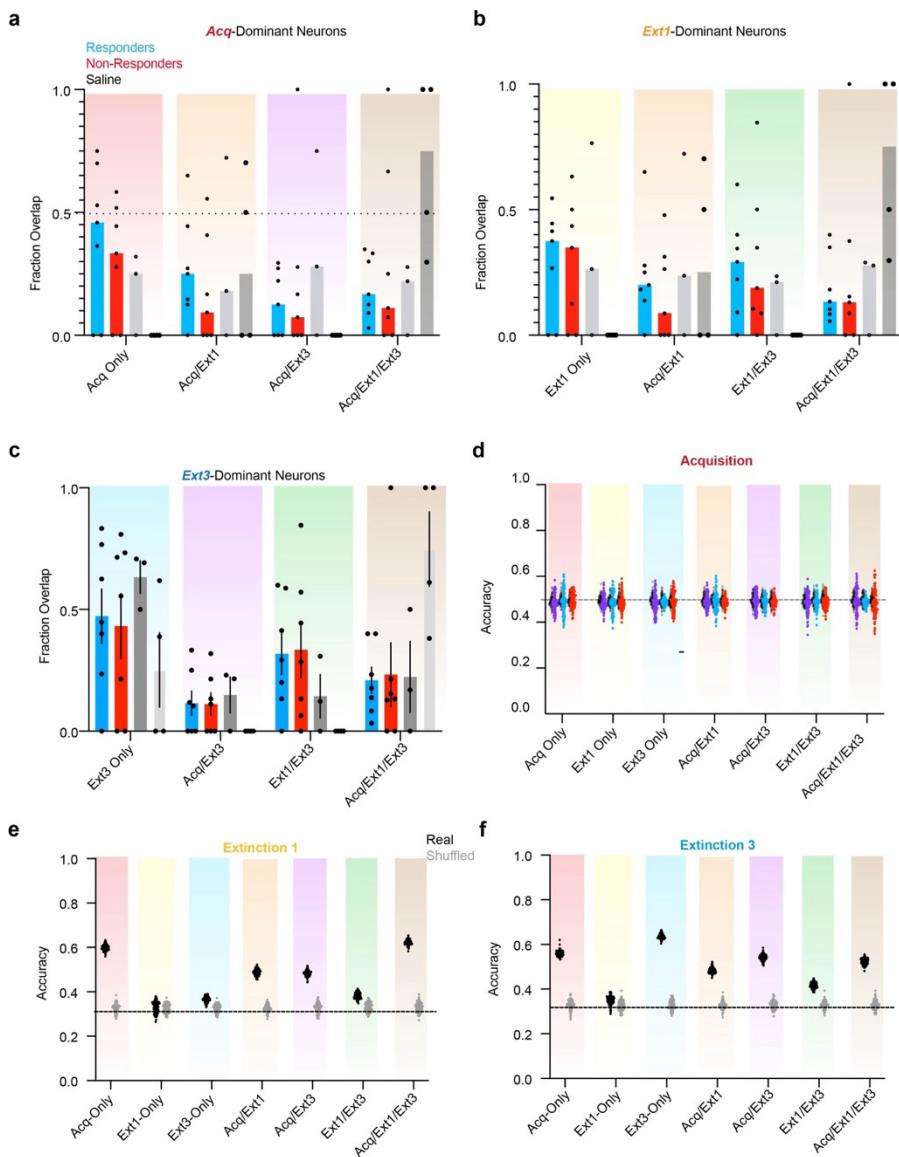

Supplementary Figure 2 continued | All RSC cells recorded.

a. Center and bottom of implant tracts of all included mice from anterior (left) to posterior (right) granular RSC. **b.** Fraction of freezing encoding neurons on each day. Two-way RM ANOVA. (Supp. Table 1, row 112) **c.** Mean fraction of tone-responsive neurons on each day. Insets are proportions of neurons with suppressed, recruited, and stable responses. Two-Way ANOVA. (Supp. Table 1, rows 113-117) **d.** Heatmaps displaying significant correlations (Pearson's rho) between proportions of total (Tot), suppressed (Sup), recruited (Rec), and stable (Sta) tone-responsive neurons on each day and % freezing during the early (E) and late (L) halves of each session (black rows = Hab freezing and black columns = fractions of neurons during Hab, red = Acq, yellow = Ext1, green = Ext2, blue = Ext3). **e,g,i.** Same as C for trace-, tone-and-trace, and shock-responsive neurons. Two-Way ANOVA. (Supp. Table 1, rows 118-132) **f,h,j.** Same as D for trace-, tone-and-trace, and shock-responsive neurons. Data are represented as mean \pm SEM. * p \leq 0.05, ** p < 0.01, *** p < 0.001, **** p < 0.0001.

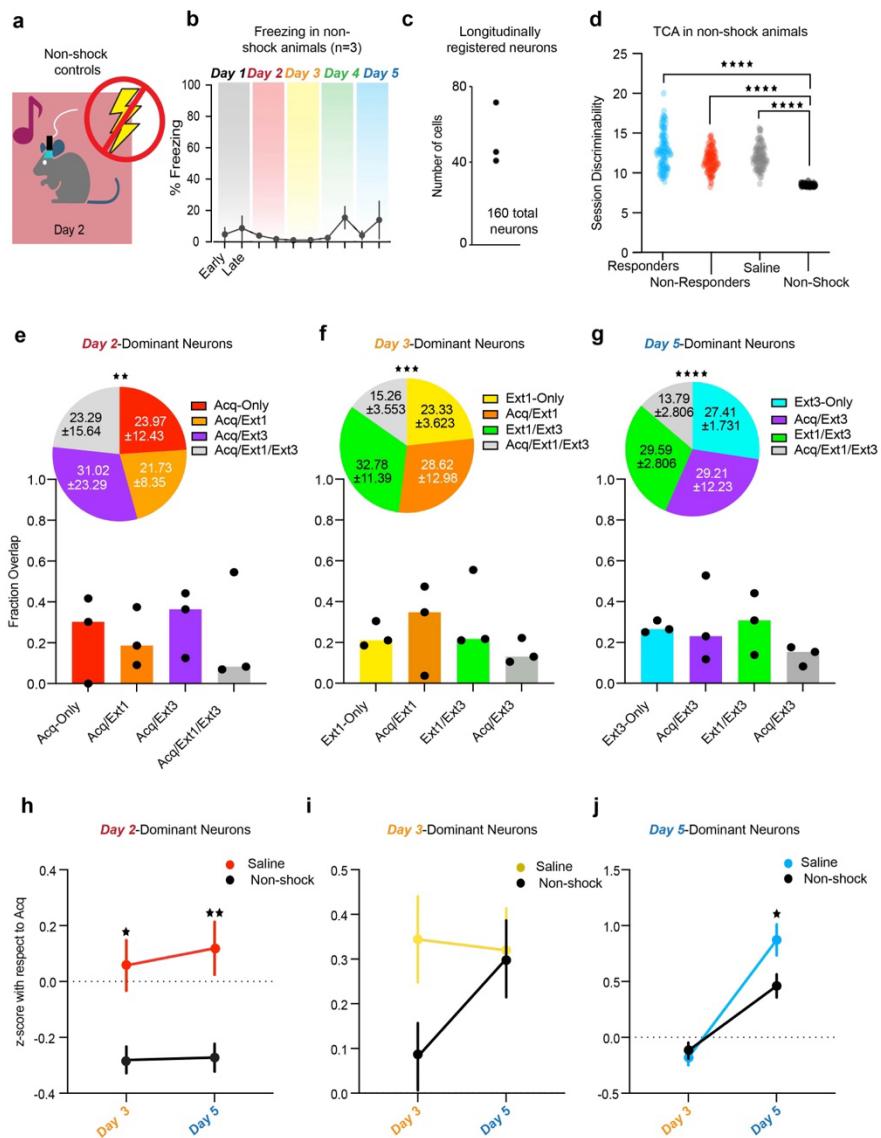

Supplementary Figure 3 | TCA factors reveal RSC dynamics modulated by session.

a. Normalized temporal factor weights by group of the Habituation-dominant component. Two-Way RM ANOVA. (Supp. Table 1, row 133) **b.** Same as A) for the Acquisition-dominant component. Two-Way RM ANOVA. (Supp. Table 1, row 134) **c.** Same as A) for the Extinction 1-dominant component. Two-Way RM ANOVA. (Supp. Table 1, row 135) **d.** Same as A) for the Extinction 2-dominant component. Two-Way RM ANOVA. (Supp. Table 1, row 136) **e.** Same as A) for the Extinction 3-dominant component. Two-Way RM ANOVA. (Supp. Table 1, row 137) Data are represented as mean \pm SEM. * p \leq 0.05, ** p < 0.01, *** p < 0.001, **** p < 0.0001.

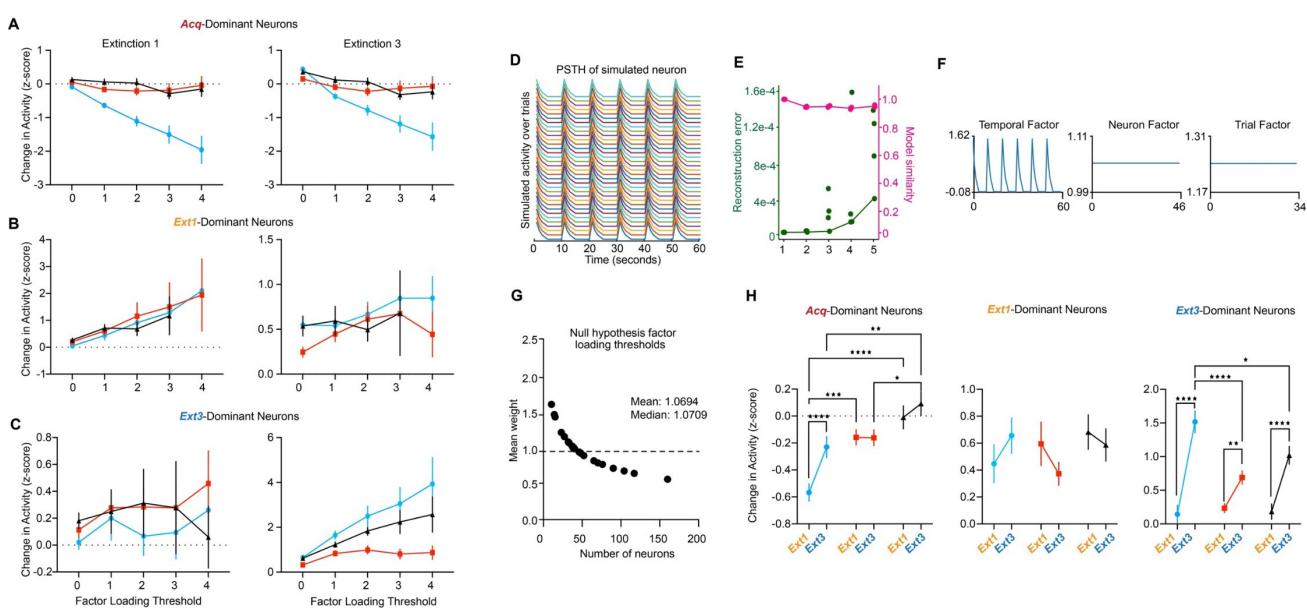

Supplementary Figure 4 | Psilocybin bidirectionally modulates neural ensembles driving RSC dynamics during TFC in responders.

a. Overlaps of ensembles within individual animals comprising the mean values in Fig. 4B top. Bars are median. b. Same as A for Fig. 4B middle. c. Same as A for Fig. 4B middle. d. Fisher decoder performance on Acquisition activity in functionally defined ensembles of cells to distinguish responders vs. non-responders (purple), responders vs. rapid saline (blue around grey), and non-responders vs. rapid saline (red around grey). 100 iterations for each comparison. Shuffled values are behind real values. e. Three-way Fisher decoder performance classifying responders vs. non-responders vs. rapidly extinguishing saline mice trained on activity during Extinction 1. f. Same as E for Extinction 3 activity.

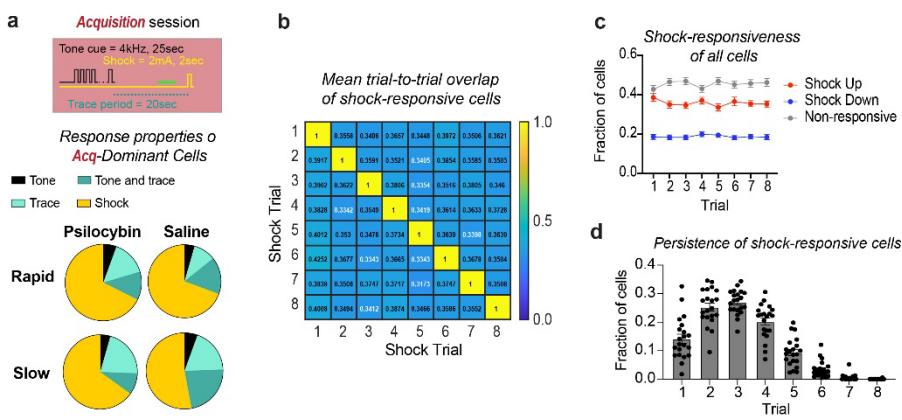

Supplementary Figure 5 | Non-shock controls do not exhibit conditioning-associated dynamics.

a. Schematic of non-shock protocol. 3 Miniscope implanted mice underwent identical 5 day paradigm to all other mice, with the exception that they received no shock during Acquisition or drug treatment. **b.** Half-session freezing in non-shock mice. (Supp. Table 1, row 138). **c.** Number of longitudinally registered neurons in non-shock mice. **d.** Sum of session discriminability index. Because roughly half the number of neurons were recorded in non-shock mice as in the other two groups, pooled tensors from psilocybin responders, non-responders, and saline mice were subsampled to a different, random set of 160 neurons in each of 100 iterations of TCA. One-Way ANOVA. (Supp. Table 1, rows 139). **e.** Overlap of the Day 2-dominant ensemble with Day 3- and Day 5-dominant ensembles in non-shock mice. Bar graphs display the median fraction overlaps. Dots are individual animals. Insets are pie charts displaying total overlap. Stars indicate comparison to saline distribution. Chi-square. (Supp. Table 1, rows 140) **f.** Same as E for the Day 3-dominant ensemble. Chi-square. (Supp. Table 1, rows 141). **g.** Same as F for the Day 5-dominant ensemble. Chi-square. (Supp. Table 1, rows 142) **h.** Average z-score with respect to Day 2 of Day 2-dominant ensemble during Day 3 and 5 in non-shock mice (black) compared to conditioned, saline-administered mice. Two-Way RM ANOVA. (Supp. Table 1, rows 143). **i.** Same as H for the Day 3-dominant ensemble. (Supp. Table 1, rows 144). **j.** Same as H for the Day 5-dominant ensemble. (Supp. Table 1, rows 145). Data are represented as mean \pm SEM. * p \leq 0.05, ** p < 0.01, *** p < 0.001, **** p < 0.0001.

Supplementary Figure 6 | Results are robust to changes in factor loading thresholds.

a. Change in activity in mean \pm SEM from *Acquisition* in *Acq*-dominant neurons as a function of factor loading thresholds varying between $w=0-4$ during *Extinction 1* (left) and *Extinction 3* (right). **b.** Same as A) for *Ext1*-dominant neurons. **c.** Same as A) for *Ext3*-dominant neurons. **d.** PSTH of an example simulated neuron to determine the null hypothesis factor loading threshold. Tensors of $t \times c \times T$ size, where c is the number of neurons recorded in a given animal, were created with identically behaving neurons to determine the factor loading threshold in a hypothetical population in which each neuron equally contributes to dynamics, or the null hypothesis factor loading threshold for that animal. **e.** Reconstruction error and model similarity of varying model ranks for populations of identical neurons. A model of rank 1 yields 0 error in this case. **f.** Representative rank 1 TCA of a simulated dataset with $n=46$ neurons, the median number of neurons recorded in this study. Because variances across trials and neurons were clamped at 0, only the temporal factor varies. **g.** Data in Fig. 4A plotted as a function of number of neurons recorded. Mean weight of neuron factors across 100 iterations of TCA at the number of cells recorded in each animal. **h.** Change in activity in mean \pm SEM from *Acquisition* during *Extinction 1* and *3* in *Acq*-dominant (left), *Ext1*-dominant (middle), and *Ext3*-dominant (right) using ensembles determined with the null hypothesis factor loading for each animal. Two-way RM ANOVA. (Supp. Table 1, rows 88-90) . * $p \leq 0.05$, ** $p < 0.01$, *** $p < 0.001$, **** $p < 0.0001$.

Supplementary Figure 7 | Shock-responsive neurons are unstable in the RSC.

a. Average proportions of Acq-dominant neurons in each group that were upregulated in response to shock, trace, tone, or tone-and-trace. **b.** Heatmap of the average fraction of overlap in shock-up neurons between each trial of Acquisition. Average overlap between trials ranges from 30-45%. **c.** Fractions of shock-up, shock-down, or shock-nonresponsive neurons across all 21 mice on each trial of acquisition, determined by permutation test. **d.** Persistence of the response properties of shock-up neurons over the session. Each point y is the fraction of neurons upregulated in response to the shock for x number of trials. Data are represented as mean \pm SEM over all 21 mice.
