

Supplementary Figure 1

Supplementary Figure 1. IFN- γ ELISpot response post-IVS. Patient PBMCs (Pt1 and Pt4) from available post vaccination time points were in vitro restimulated with patient specific pools which did not elicit a positive immune response ex-vivo. Graphs show mean SFC per 10⁶ PBMCs for triplicate ELISpot wells. An unpaired t test was used to detect significant differences between pre-IVS and post-IVS cultures (****p <0.0001; ***p<0.001).
