Supplement Section 1. Identification of policy implementation waves

A team of policy analysts performed a review of state policies to identify start dates for state Medicaid policies that allowed for separate reimbursement for immediate postpartum long-acting reversible contraception (LARC) in hospital settings. Only states with sufficient data quality as measured using DQ Atlas assessments (Supplement Section 2) were reviewed. The steps used to identify policies and start dates is described below and in Supplement Figure 1. Full details of the policy review results for each state is provided in Supplement Table 1.

1. For each state, we checked for LARC device reimbursement policies on three websites. We compared responses for consistency.

- A. **MACPAC** – (3/2020) Mathematica, under contract, compiled a spreadsheet of Medicaid Initiatives in states including LARC policies with start dates and original language¹.
- B. **DHHS CMS Informational Bulletin** (4/8/16) - a state agency policy scan of innovative state LARC reimbursement strategies².
- C. **ACOG Website** – (updated 4/2022) -compiled links to state agency Medicaid LARC policies³.

2. If no specific policy information was available, we performed an Internet search for policies using various search terms combinations including “State” “Medicaid,” “LARC,” “Hospital,” “Inpatient,” “Reimbursement,” “IUD,” and “Device.”

3. We prioritized using original source text from state Medicaid agency policy guidelines, rules and bulletins on LARC reimbursement to determine policy start date and policy details. The next priority level was using information from secondary sources, such as policy scans from MACPAC, a research publication, or other policy summary. In two instances, ID and NV, we contacted state Medicaid agencies to get clarity on policy information.

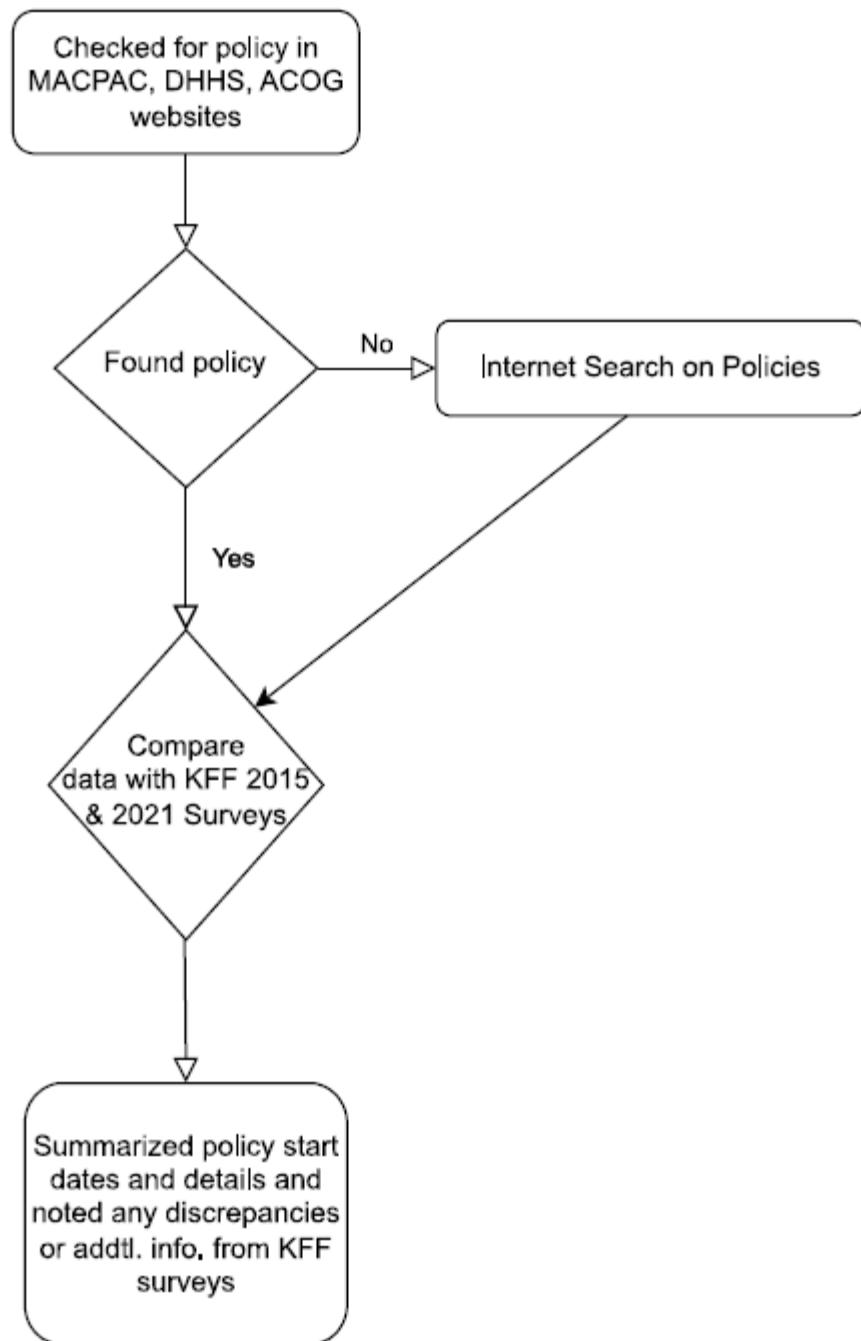

4. To validate our findings, we compared KFF surveys on State Medicaid Coverage for LARC Reimbursement for 2015⁴ and 2021⁵. These surveys indicated whether LARC device reimbursement was separate or global (under the maternity global DRG) for both hospital and provider reimbursement. Although survey data usually corresponded with our findings, there were several instances when the responses contradicted with original state Medicaid agency policy guidance. KFF seemed generally accurate, but not completely reliable. Other limitations of KFF data were checkbox responses only (separate/global) and no indication of policy start dates.

5. We noted, under “Summary,” state agency policy start dates based on original/secondary state agency policy documentation, prioritized finding hospital reimbursement policies, and noted when KFF had contradictory or additional info., not found in our policy scan. For example, we indicated the policy start date for Oregon was 1/1/17, based on state health authority information of separate hospital reimbursement for postpartum LARC. If we found state agency policy guidance on a separate hospital

reimbursement policy, we did not search for a separate provider reimbursement policy. In our summary, we use policy start date of 1/1/17 for hospital reimbursement and noted that provider reimbursement might have started in 2015 or earlier per KFF surveys.

6. Based on the information found in steps 1-5, the principle investigator assigned each state to one of three groups: (1) Treatment states – those that implemented a policy during the study period, (2) Control states – states that did not implement the policy or implemented the policy following the end of the study period, (3) Excluded states – those that either implemented the policy prior to the start of the study period or those that could not be classified into the other two groups.

Supplement eFigure 1. Flowchart describing process for identifying policy dates

Supplement Section 2. State selection

To select states with adequate data quality for analysis we used assessments published by the Centers for Medicare & Medicaid Services DQ Atlas⁶ and supplemented our own analyses of the data quality where necessary. We began with all 50 states and the District of Columbia and looked at data quality assessments for TAF RIF Release 2 from 2016, 2017, and 2018 and TAF RIF Release 1 from 2019.

After excluding 22 states that had already implemented an IPP LARC separate billing policy prior to 2016 (Arizona, California, Connecticut, Delaware, Georgia, Hawaii, Idaho, Illinois, Indiana, Iowa, Louisiana, Missouri, Montana, New Mexico, New York, Oklahoma, Pennsylvania, South Carolina, South Dakota, Texas, Vermont, Washington) and 4 states and territories with an unclear policy or policy date (Alaska, District of Columbia, Massachusetts, Nevada), 25 states remained for data quality assessment.

Six states classified as unusable or high concern in any of the relevant assessments for any of the measurement years were excluded from our analysis:

- 2 states with high concern Total Medicaid and CHIP Enrollment (Maine and Rhode Island).
- 2 states with unusable procedure codes on inpatient claims (Kentucky and Maryland).
- 1 state with unusable diagnosis codes on inpatient claims (Tennessee).
- 1 state with unusable procedure codes on professional Other Services claims (Utah).

To assess the remaining 19 states, we conducted two additional assessments of overall TAF data quality. First, we looked at the proportion of enrollment records missing all eligibility information (MISG_ELGLTY_DATA_IND = 1) and classified states from Low Concern to Unusable based on the same cut-points used in the DQ Atlas assessments of missing gender and missing age on enrollment records (Supplement eTable 2).

Second, we calculated the Claims Volume assessments for our population of interest (Supplement eTable 3 and eTable 4). Because variation in claims volume is not necessarily a sign of poor data quality but may still flag problematic states, we only considered those states classified as unusable on this measure for exclusion.

From these assessments we excluded an additional four states:

- 2 states with high concern (> 20%) missing eligibility records (Alabama and Arkansas)
- 1 state with unusable Other Services (OT) claims volume in our population (Florida)
- 1 state with unusable pharmacy (RX) claims volume in our population (Mississippi)

In total we excluded 35 states and the District of Columbia from analysis based on inadequate data quality or IPP LARC policies. Our remaining cohort included 15 states (Colorado, Kansas, Michigan, Minnesota, Nebraska, New Hampshire, New Jersey, North Carolina, North Dakota, Ohio, Oregon, Virginia, West Virginia, Wisconsin, Wyoming).

Supplement eTable 1. Assessment of fully missing eligibility information by state

Year	State	DQ Assessment	# Beneficiaries	% Beneficiaries with Missing Eligibility Record
2016	Alabama	Medium concern	1,505,574	10.5

Supplement Section 3. Staggered Difference-in-differences model specification

We assessed the association of the policy with each of our outcomes using a staggered difference-in-differences model as described in Sun and Abraham, 2021⁷. We modeled our outcome using a linear probability model with the following form:

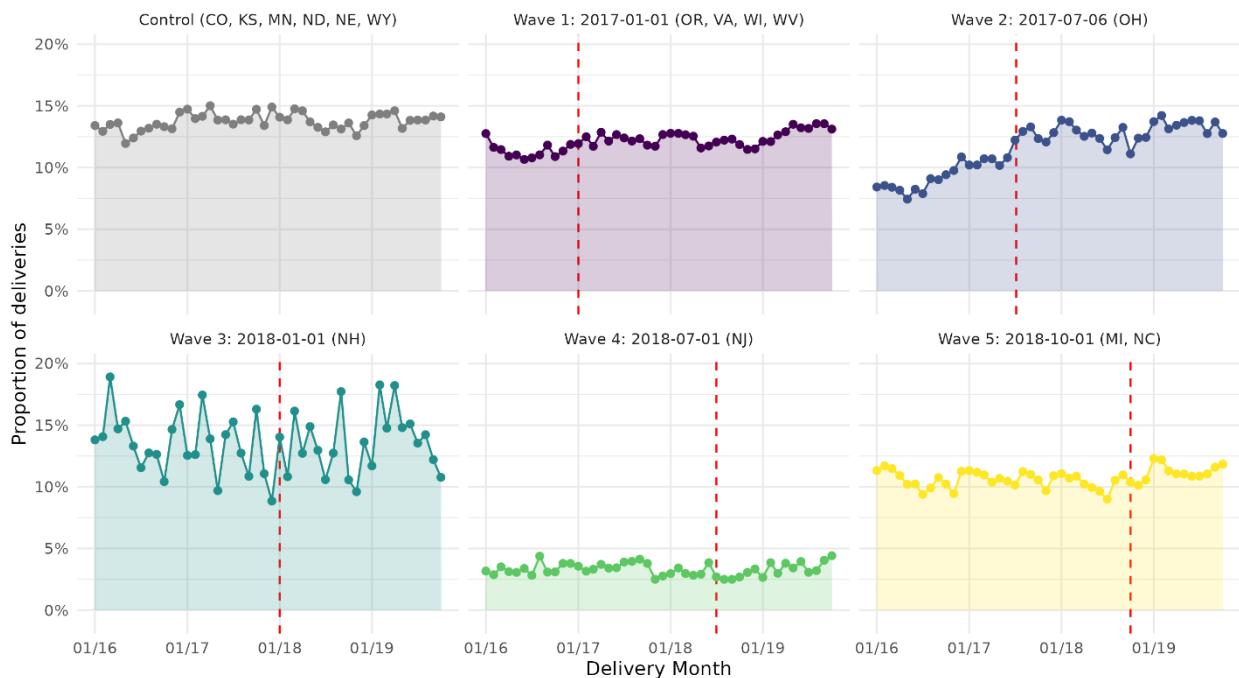

$$Y_{ist} = \beta_0 + \vec{\beta}_1 \overrightarrow{Wave}_{is} + \vec{\beta}_2 \overrightarrow{Month}_{it} + \vec{\beta}_3 \overrightarrow{Wave}_{is} \overrightarrow{MonthsFromPolicy}_{ist} + \vec{\beta}_4 \vec{X}_{ist} + \varepsilon_{ist}$$

Where Y_{ist} represents the outcome Y for delivery i in state s and month t , β_0 is the intercept, $\vec{\beta}_1 \overrightarrow{Wave}_{is}$ is a vector of policy implementation wave fixed effects to account for baseline differences between implementation wave, and $\vec{\beta}_2 \overrightarrow{Month}_{it}$ is a vector of month fixed effects to account for nationwide secular time trends. Our coefficients of interest are $\vec{\beta}_3$, representing the policy effect estimates associated with each policy in each month pre- and post-implementation. $\overrightarrow{Wave}_{is} \overrightarrow{MonthsFromPolicy}_{ics}$ is a vector of interaction terms between the policy implementation wave of the state the policy occurred in $\overrightarrow{Wave}_{is}$ and the months since the policy implementation in that wave. These interaction terms are only created for months that have study data, and we exclude terms for the period three months prior to the policy as a reference group to avoid overparameterizing the model and to allow for short term anticipatory effects prior to the policy implementation. For example, wave 1 implemented the policy 5 months after the start of the study period, and thus we will create interaction terms for months four and two through one months prior to study and for months 0 through 33 months following the implementation of the policy. In total, the model contains 113 such interaction terms. $\vec{\beta}_4 \vec{X}_{ist}$ controls for the effect of patient and state characteristics \vec{X}_{ist} , and ε_{ist} represents the normally distributed error term.

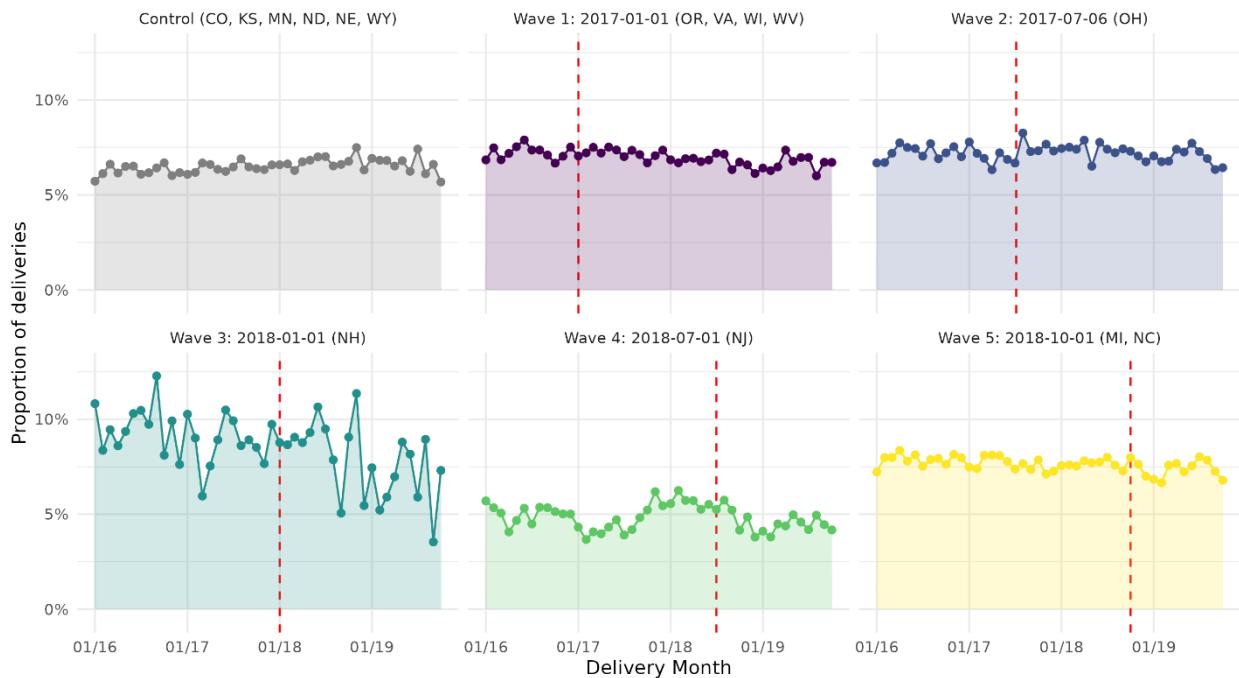

Aggregate measures of treatment effect at the population level, the month-level, and the policy implementation wave level were estimated by averaging the interaction term coefficients weighted by the relative population size captured by each month and wave combination. We used a post-hoc Huber-White cluster robust standard error correction to cluster the standard errors at the state level.

Supplemental Section 4. Unadjusted time trends for secondary outcomes

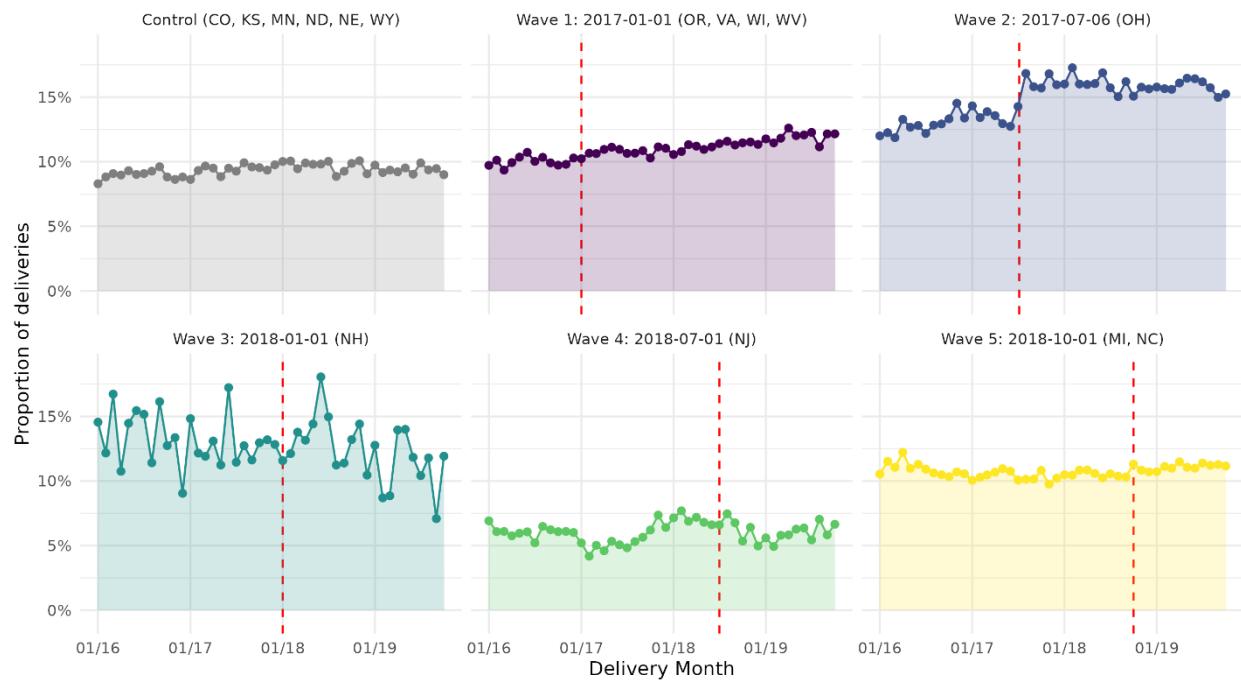

Supplemental eFigure 2. Unadjusted monthly rates of Interval LARC over time stratified by policy implementation wave

Supplemental eFigure 3. Unadjusted monthly rates of 7-day postpartum sterilization over time stratified by policy implementation wave

Supplemental eFigure 4. Unadjusted monthly rates of 7-day most or moderately effective contraception use over time stratified by policy implementation wave

Supplement Section 5. Assessing parallel pre-trends for IPP LARC

One of the assumptions of the staggered difference-in-differences model is that changes over time in each policy wave would follow the same trend as changes over time in the control wave in the absence of treatment. We tested this assumption by estimating time trends for each wave in the pre-policy period using a linear model with interaction terms between policy wave and continuous months since the start of the study. These interaction terms allowed us to test whether those trends significantly differed from the time trend for the control group of states that did not receive the policy. Estimates for the difference in time trends from the control group for each wave and each outcome are presented below:

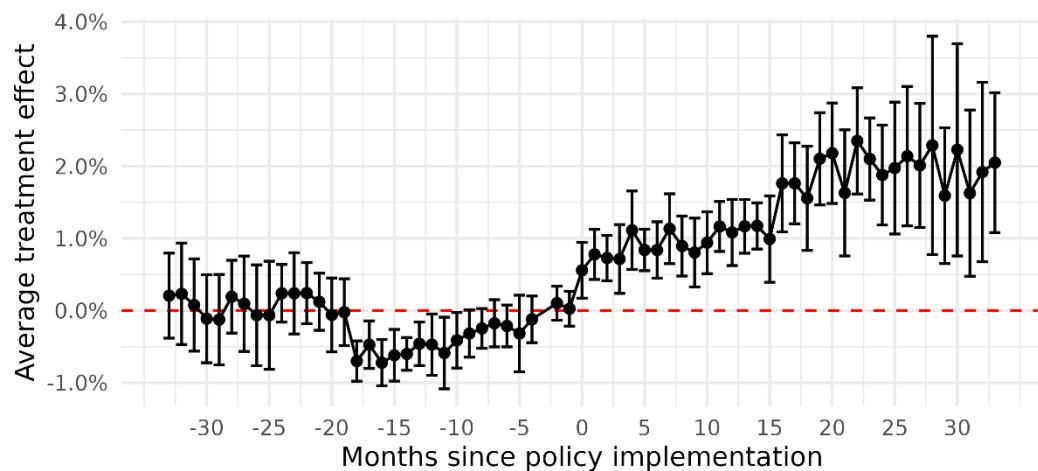

Supplement eTable 4. Differences in pre-policy trends of IPP LARC by wave

Wave	Estimate	Std. Error	p-value
Wave 1	-0.00005	0.00013	0.665
Wave 2	0.00137	0.00008	<0.001
Wave 3	-0.00059	0.00007	<0.001
Wave 4	-0.00007	0.00007	0.353
Wave 5	- 0.000002	0.00008	0.979

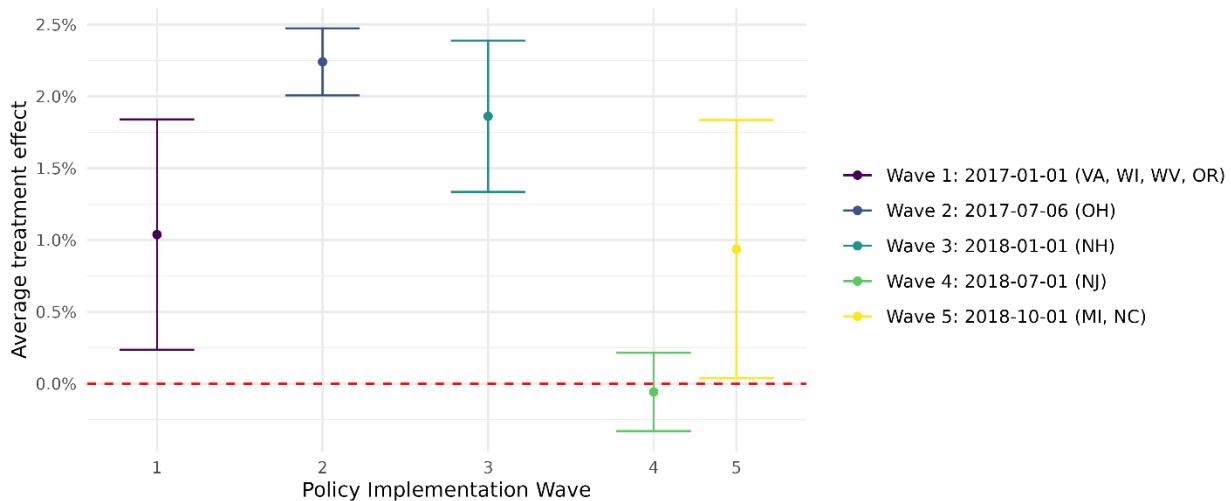

Supplement Section 6. Sensitivity Analysis for IPP LARC models

To assess the impact of our detrending, we ran a sensitivity analysis on our raw (un-detrended) outcomes. The ATE for the model of raw IPP LARC rates was 1.28 percentage points (95% CI: 0.85, 1.73), slightly higher than the detrended ATE of 0.74 percentage points (95% CI: 0.309, 1.184).

Supplement eFigure 5. Estimated changes each month pre- and post-policy on use of raw IPP LARC rate

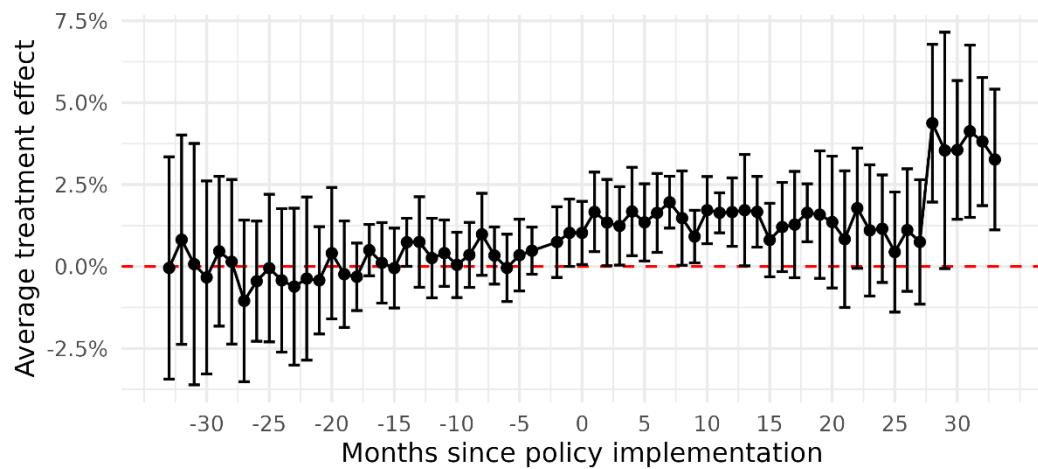

Supplement eFigure 6. Estimated changes associated with the policy for each policy implementation wave on use of raw IPP LARC

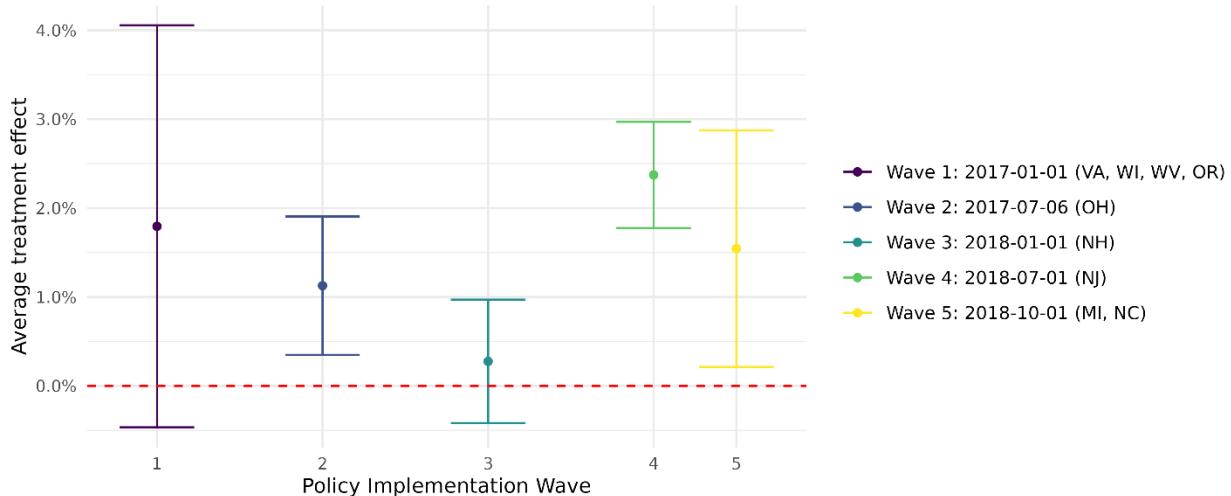

Supplement Section 7. Month-stratified and wave-stratified results for secondary outcomes

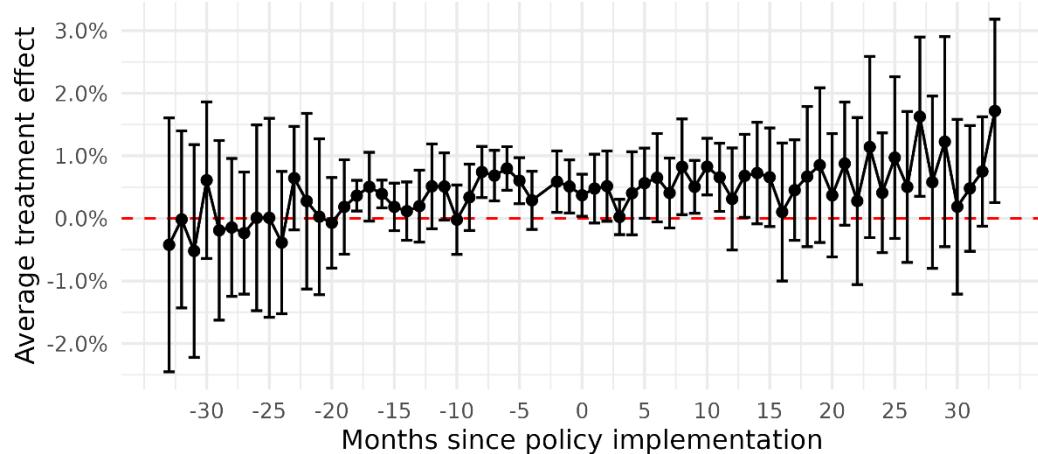

Supplement eFigure 7. Estimated changes each month pre- and post-policy on use of 60-day postpartum LARC

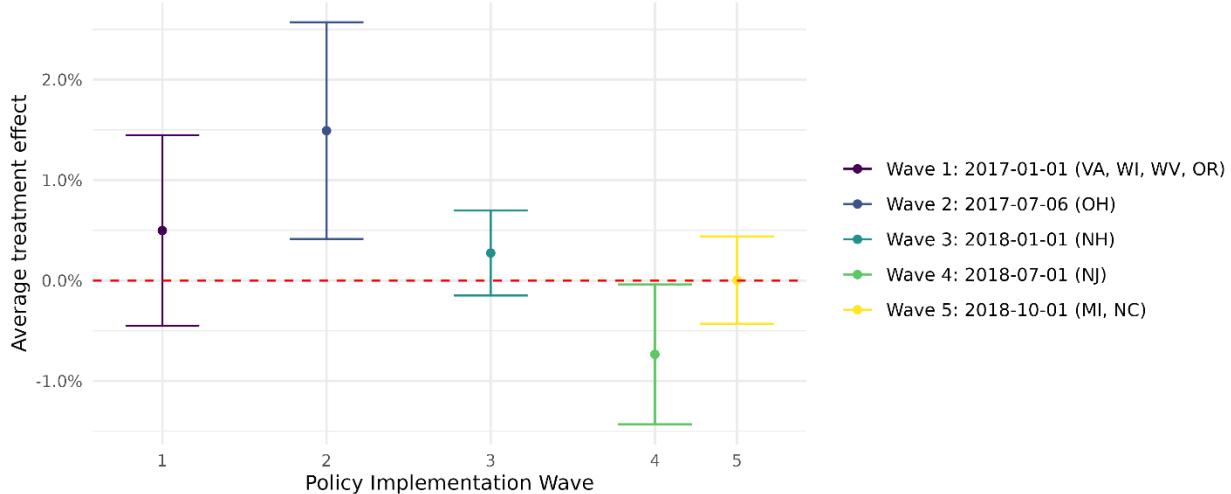

Supplement eFigure 8. Estimated changes associated with the policy for each policy implementation wave on use of 60-day postpartum LARC

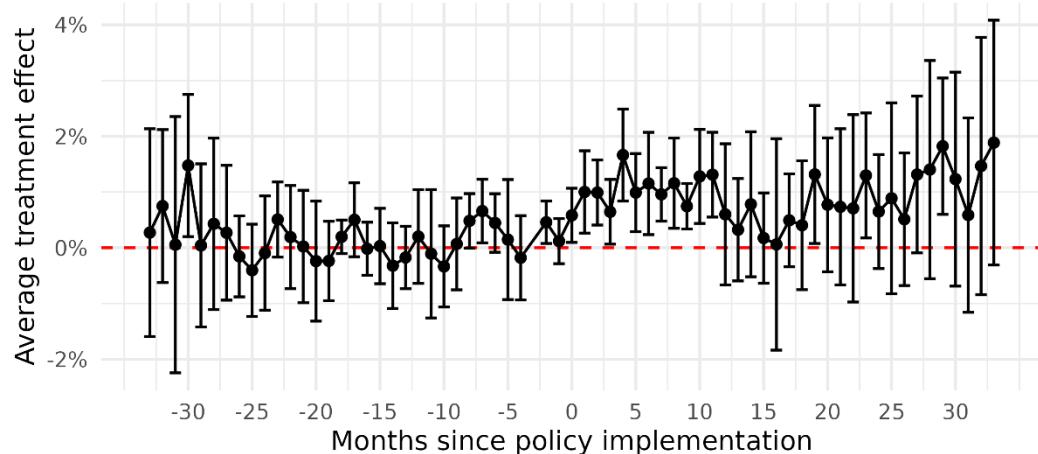

Supplement eFigure 9. Estimated changes each month pre- and post-policy on use of 7-day postpartum sterilization

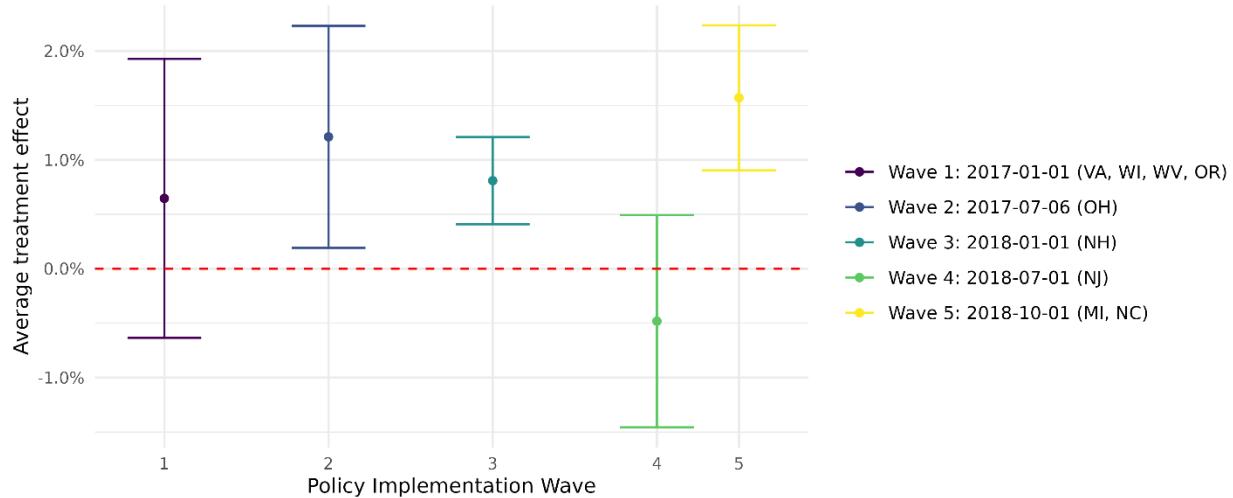

Supplement eFigure 10. Estimated changes associated with the policy for each policy implementation wave on use of 7-day postpartum sterilization

Supplement eFigure 11. Estimated changes each month pre- and post-policy on use of 7-day postpartum most or moderately effective contraception

Supplement eFigure 12. Estimated changes associated with the policy for each policy implementation wave on use of 7-day postpartum most or moderately effective contraception

Supplement Section 8. Assessing parallel pre-trends for Secondary Outcomes

Supplement eTable 5. Differences in pre-policy trends of Interval LARC by wave

Wave	Estimate	Std. Error	p-value
Wave 1	-0.00056	0.00035	0.115
Wave 2	0.00132	0.00019	<0.001
Wave 3	-0.00153	0.00012	<0.001
Wave 4	-0.00035	0.00006	<0.001
Wave 5	-0.00004	0.00023	0.081

Supplement eTable 6. Differences in pre-policy trends of 7-day postpartum sterilization by wave

Wave	Estimate	Std. Error	p-value
Wave 1	-0.00028	0.00020	0.161
Wave 2	-0.00022	0.00019	0.250
Wave 3	-0.00057	0.00009	<0.001
Wave 4	-0.000003	0.00007	0.966
Wave 5	-0.00030	0.00018	0.099

Supplement eTable 7. Differences in pre-policy trends of 7-day postpartum most or moderately effective contraception by wave

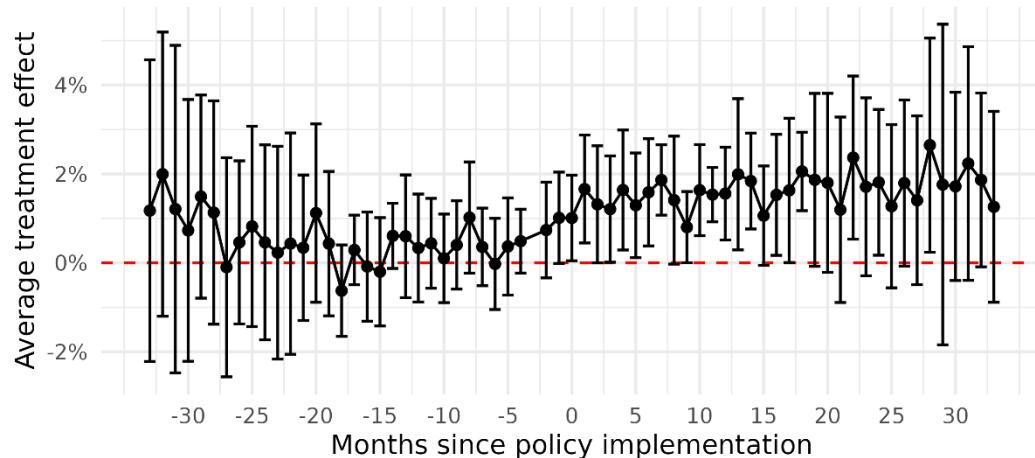

Wave	Estimate	Std. Error	p-value
Wave 1	0.00009	0.00037	0.816
Wave 2	0.00081	0.00026	0.002
Wave 3	-0.00077	0.00013	<0.001

Wave 4	-0.00004	0.00011	0.708
Wave 5	-0.00053	0.00025	0.033

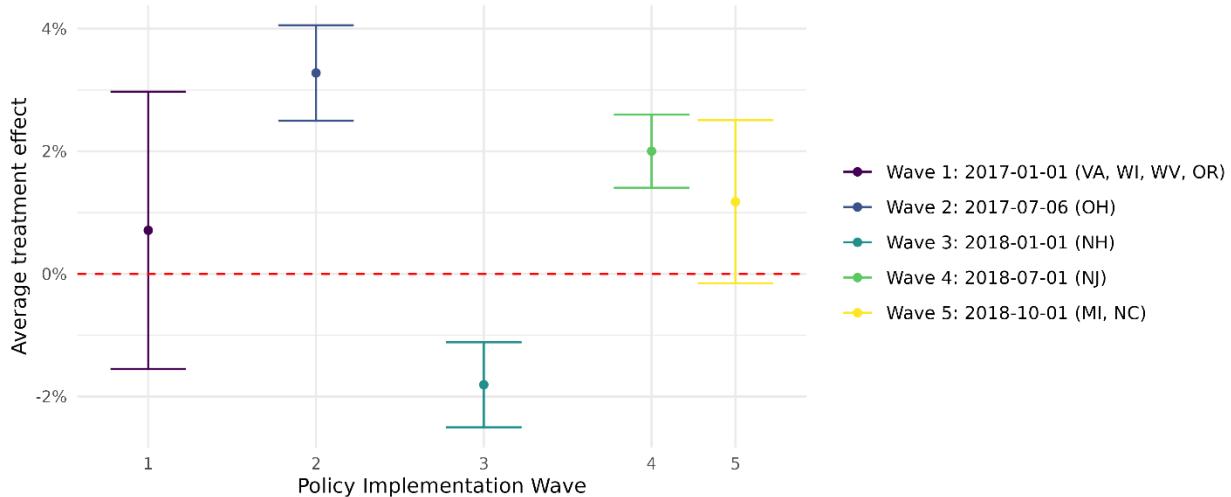

Supplement Section 9. Sensitivity Analysis for Interval LARC models

To assess the impact of our detrending, we ran a sensitivity analysis on our raw (un-detrended) outcomes. The ATE for the model of raw Interval LARC rates was 1.56 percentage points (95% CI: 0.41, 2.71), almost the same as the detrended ATE of 1.58 percentage points (95% CI: 0.43, 2.73).

Supplement eFigure 13. Estimated changes each month pre- and post-policy on use of raw IPP LARC rate

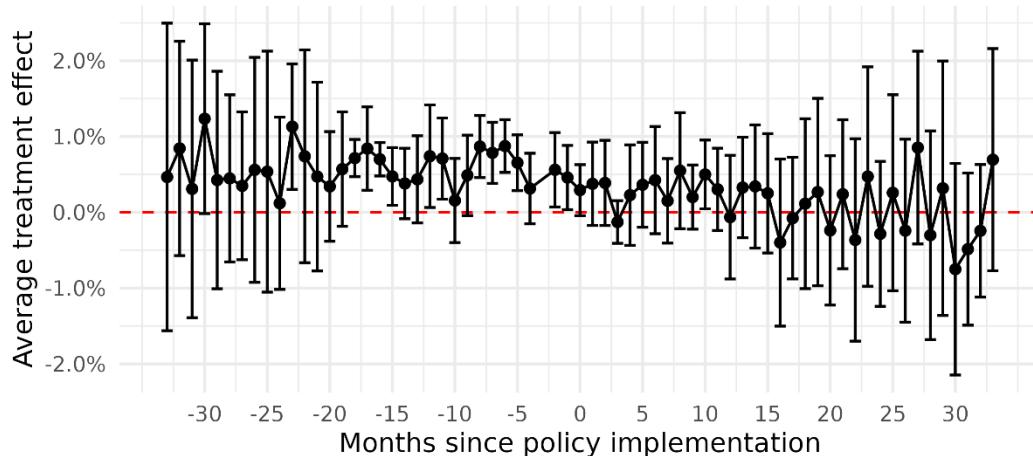

Supplement eFigure 14. Estimated changes associated with the policy for each policy implementation wave on use of raw IPP LARC

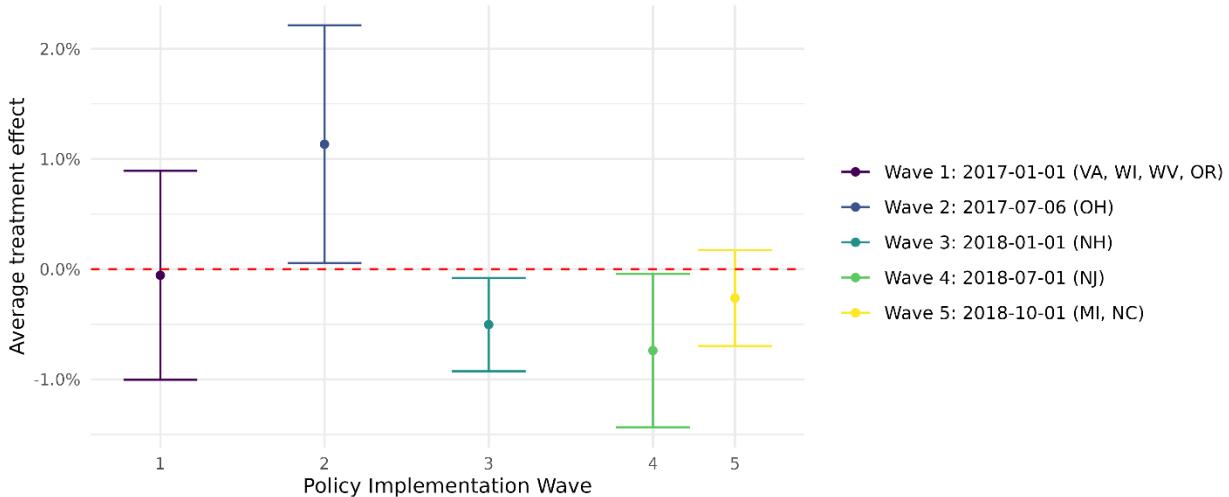

Supplement Section 10. Sensitivity Analysis for 7-day postpartum sterilization models

To assess the impact of our detrending, we ran a sensitivity analysis on our raw (un-detrended) outcomes. The ATE for the model of raw 7-day postpartum sterilization rates was 0.18 percentage points (95% CI: -0.44, 0.81), slightly lower than the detrended ATE of 0.59 percentage points (95% CI: -0.03, 1.22).

Supplement eFigure 15. Estimated changes each month pre- and post-policy on use of raw IPP LARC rate

Supplement eFigure 16. Estimated changes associated with the policy for each policy implementation wave on use of raw IPP LARC

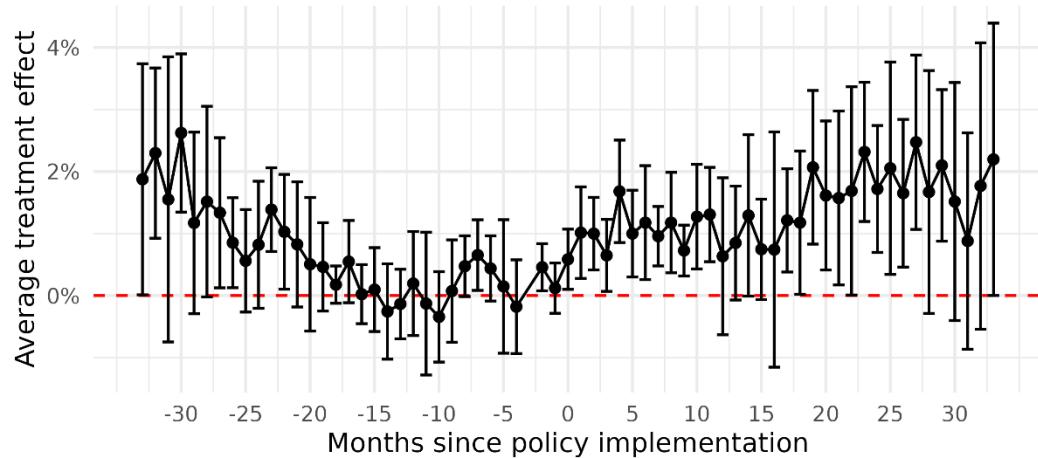

Supplement Section 11. Sensitivity Analysis for 7-day postpartum most or moderately effective contraception models

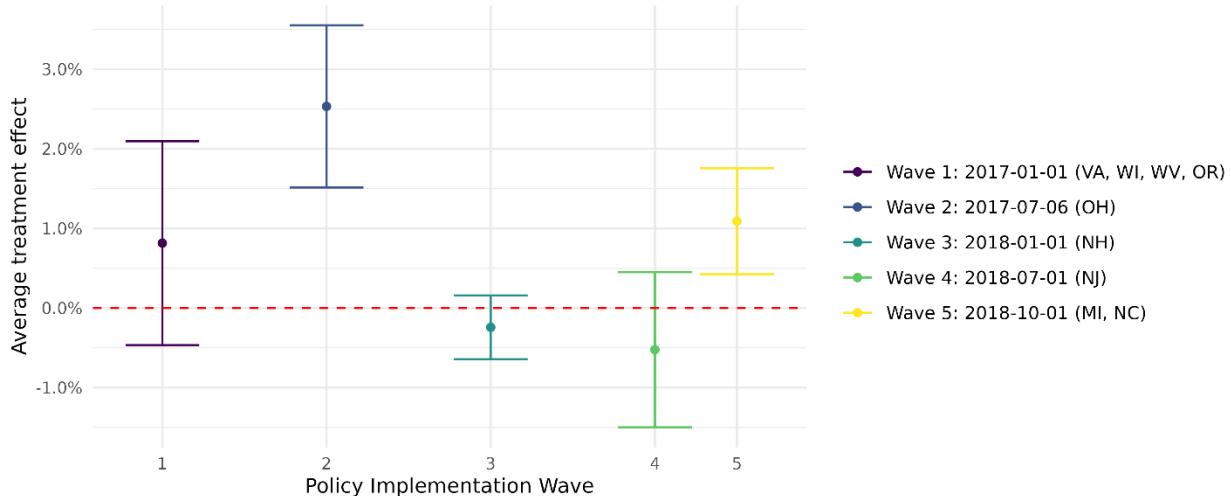

To assess the impact of our detrending, we ran a sensitivity analysis on our raw (un-detrended) outcomes. The ATE for the model of raw 7-day postpartum most or moderately effective

contraception rates was 1.24 percentage points (95% CI: 0.45, 2.03), slightly higher than the detrended ATE of 0.92 percentage points (95% CI: 0.13, 1.71).

Supplement eFigure 17. Estimated changes each month pre- and post-policy on use of raw IPP LARC rate

Supplement eFigure 18. Estimated changes associated with the policy for each policy implementation wave on use of raw IPP LARC
