

## User Defined Model For Feature Data

	Slice 1 Weight = 0.5		Slice 2 Weight = 0.2	Slice 3 Weight = 0.3
	Feature 1	Feature 2	Feature 3	Feature 4
Sample 1	•	•	●	•
Sample 2	▲	▲	▲	▲
Sample 3		■	■	■

### Aggregate Features Into Slices

	Slice 1	Slice 2	Slice 3
Sample 1	●	●	•
Sample 2	▲	▲	▲
Sample 3	■	■	■

### Rescale Slice Scores 0-1

	Slice 1	Slice 2	Slice 3
Sample 1	●	●	■
Sample 2	▲	▲	▲
Sample 3			■

### Calculate Sample Scores

	Slice 1	Slice 2	Slice 3	Score
Sample 1	●	●	■	●
Sample 2	▲	▲	▲	▲
Sample 3			■	■

Sample 2  
Score = 0.95  
Rank = 1/3

- Sample 2:
- Highest overall outcome
  - Highest Slice 1 association
  - Moderate Slice 2 association
  - Highest Slice 3 association
  - Highest prioritized sample driven by all features

Sample 1  
Score = 0.45  
Rank = 2/3

- Sample 1:
- Moderate overall outcome
  - Moderate Slice 1 association
  - Highest Slice 2 association
  - Lowest Slice 3 association
  - Moderately prioritized sample driven largely by Slice 2 features

Sample 3  
Score = 0.25  
Rank = 3/3

- Sample 3:
- Lowest overall outcome
  - Lowest Slice 1 association
  - Lowest Slice 2 association
  - High Slice 3 association
  - Lowly prioritized sample, special concerns for Slice 3 features

Feature Data

Ordinal Regression

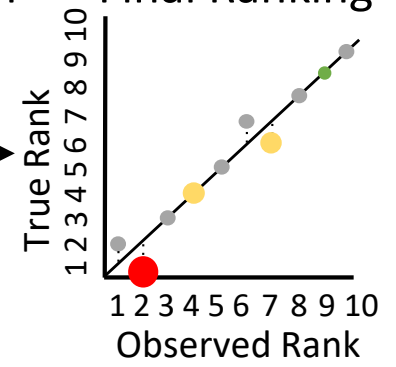

Including Unknowns

Genetic Algorithm

Final Ranking

Combination 1:  
3 Slices, 3 Knowns/Slice, 500 Samples, 2 Bins

Combination 2:  
6 Slices, 3 Knowns/Slice, 1000 Samples, 3 Bins

ToxPi Profile Layout

Data Layout

Known Samples    Unknown Samples    Total Samples

Slices:	Knowns/Slice:	Total Samples:	Bins:	Underlying Data Distribution:
{3,6,9,12,15}	{3,6,9,12,15}	{500,1000,5000,10000}	{2,3,4}	{Normal, Gamma, Beta, Mixed}

Final  $w = \{5, 30, 10, 35, 20\}$

Ordinal Weights

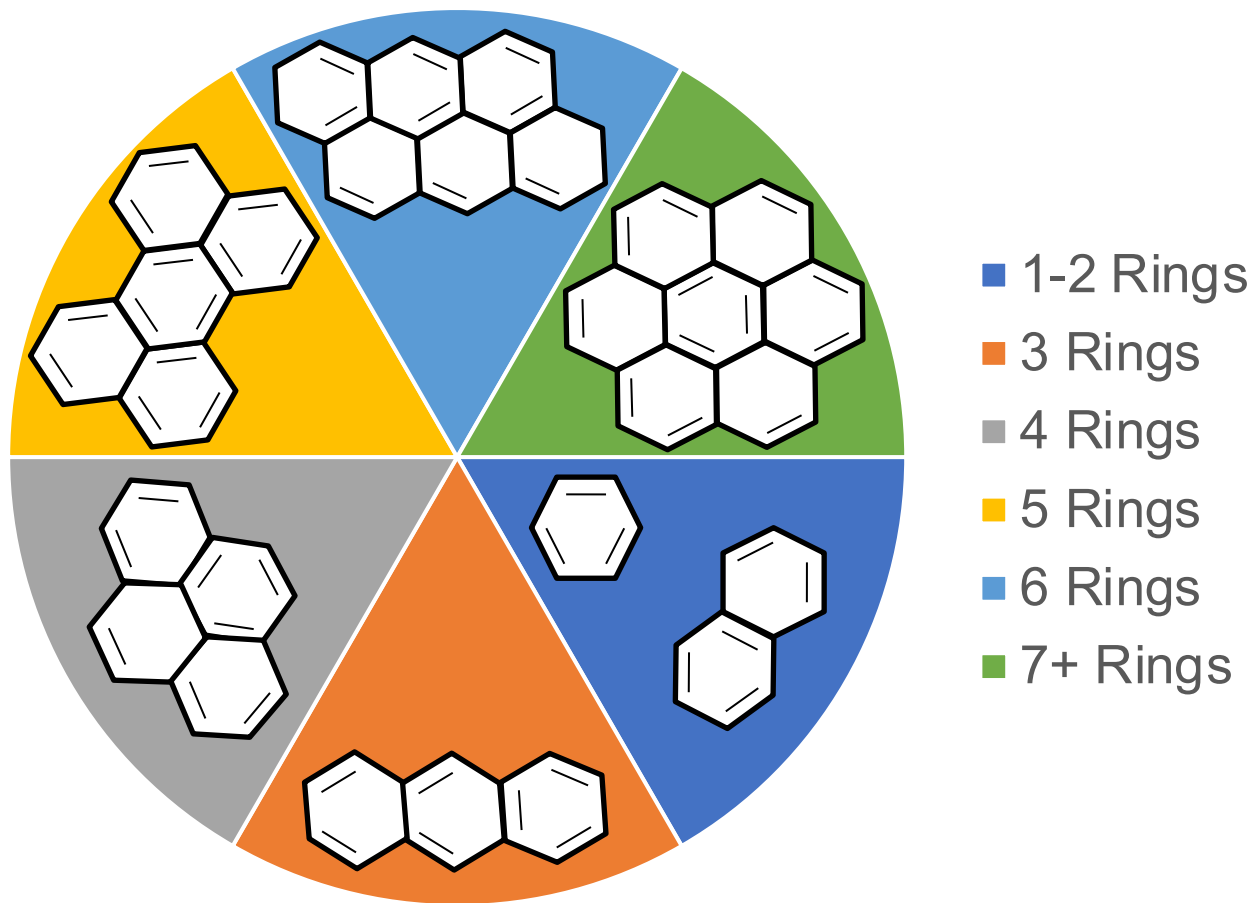

$$f = (2 - 1) * 6 + (2 - 1) * 5 = 11$$

GA Weights

$$f = 0$$

# PAC Data ToxPi Profile

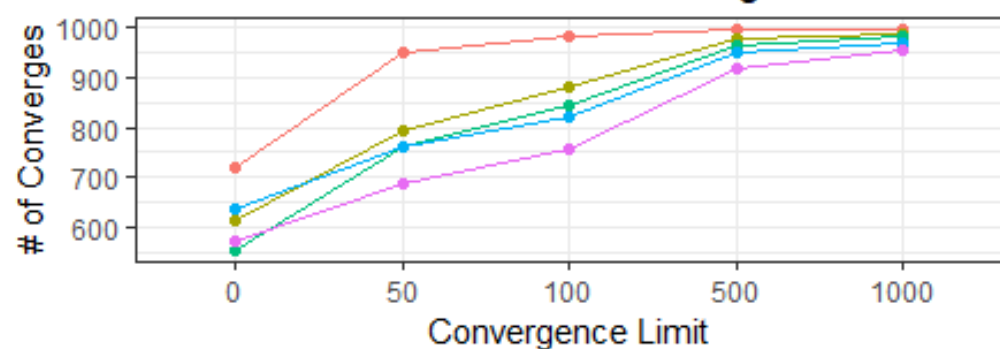

1A: # of Successful Convergences

1B: Average Change in Run Time

2A: # of Successful Convergences

2B: Average Change in Run Time

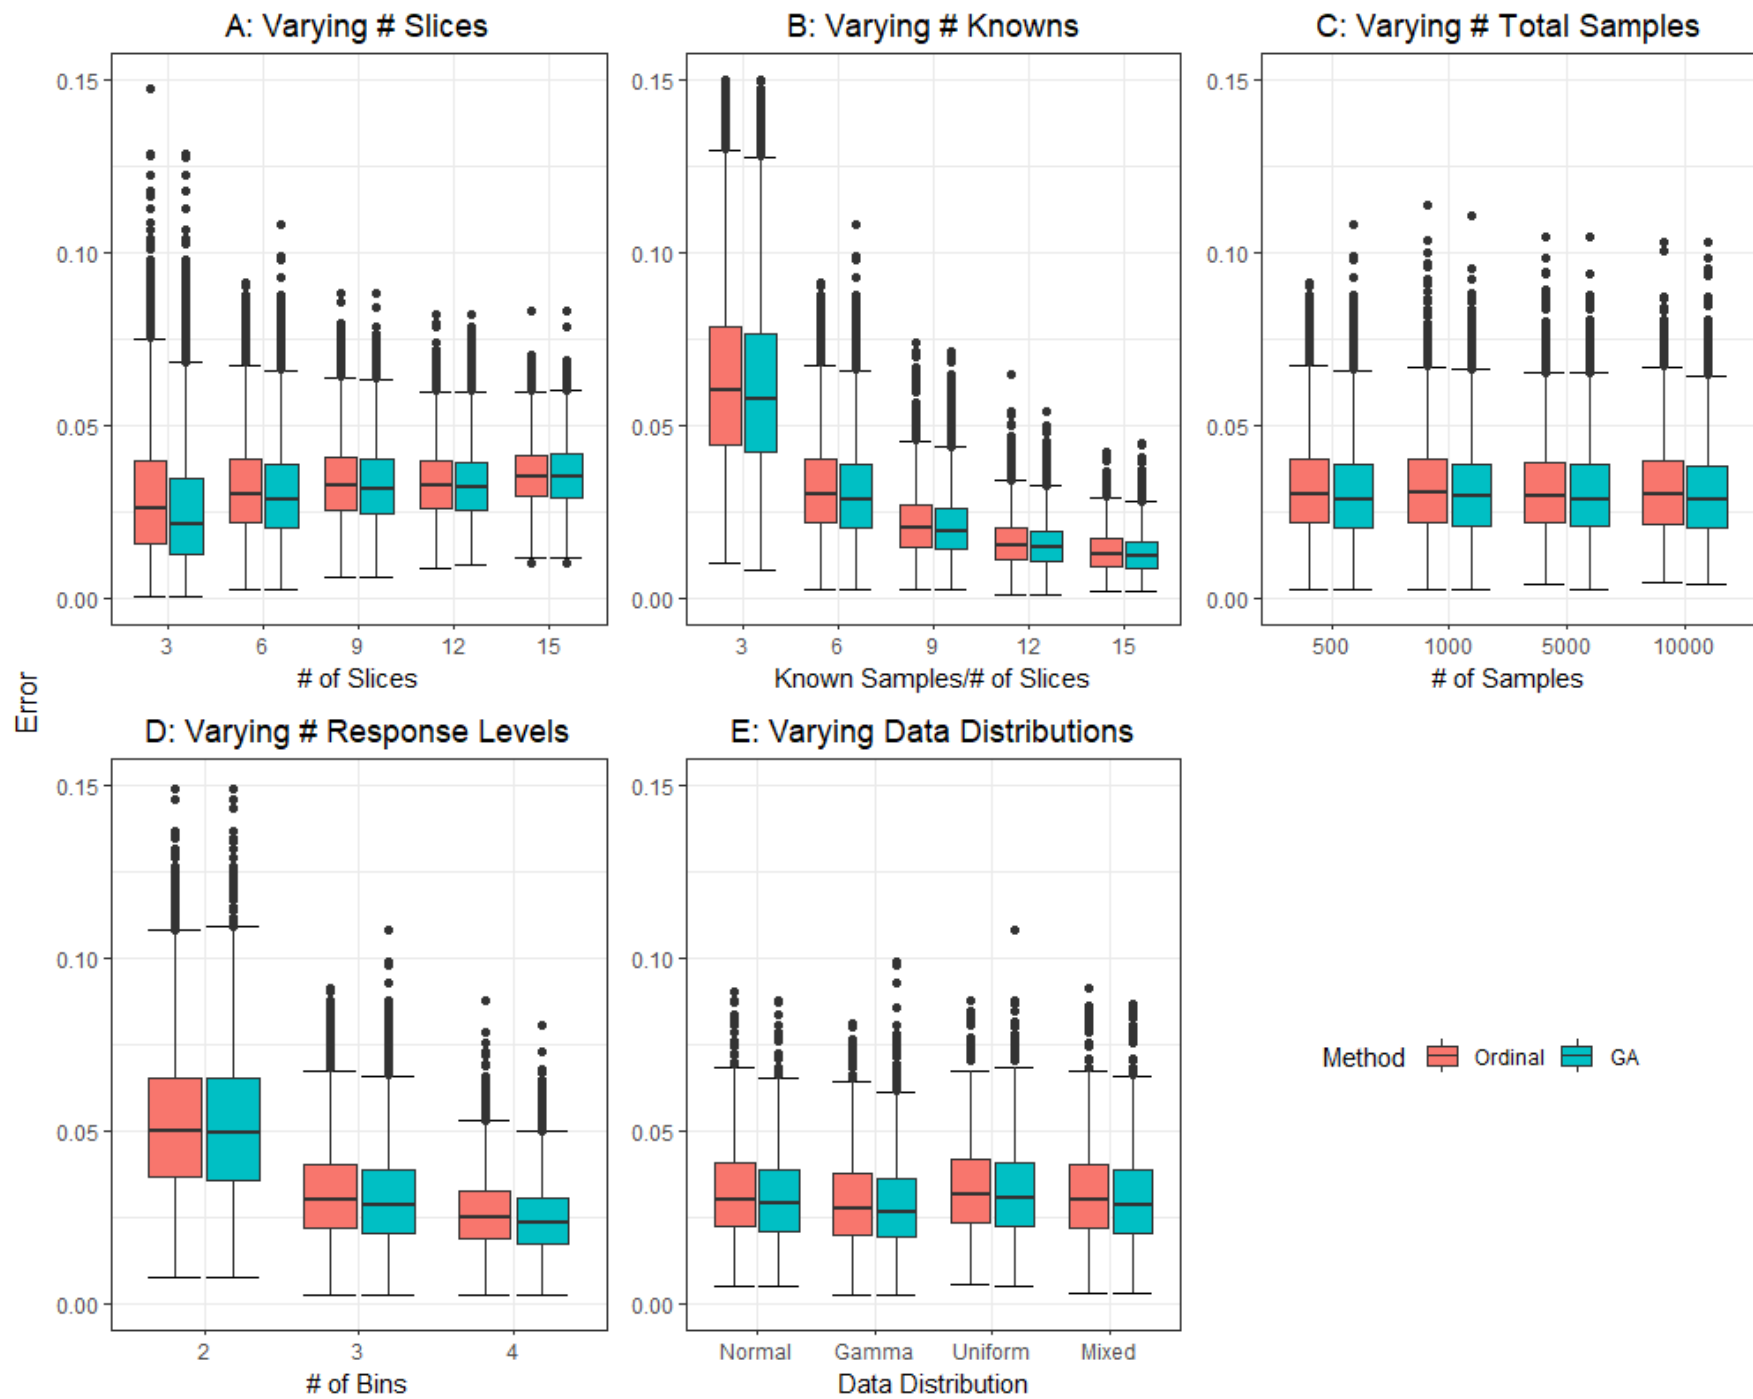

3A: # of Successful Convergences

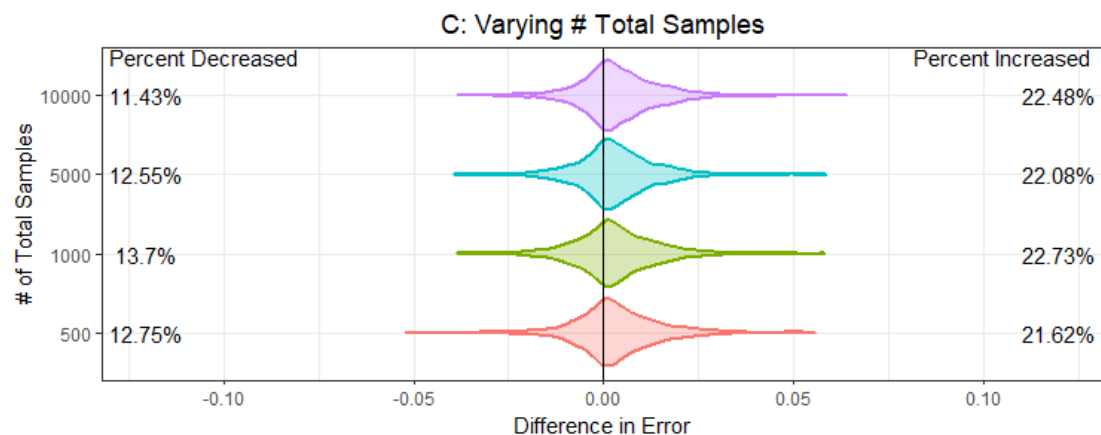

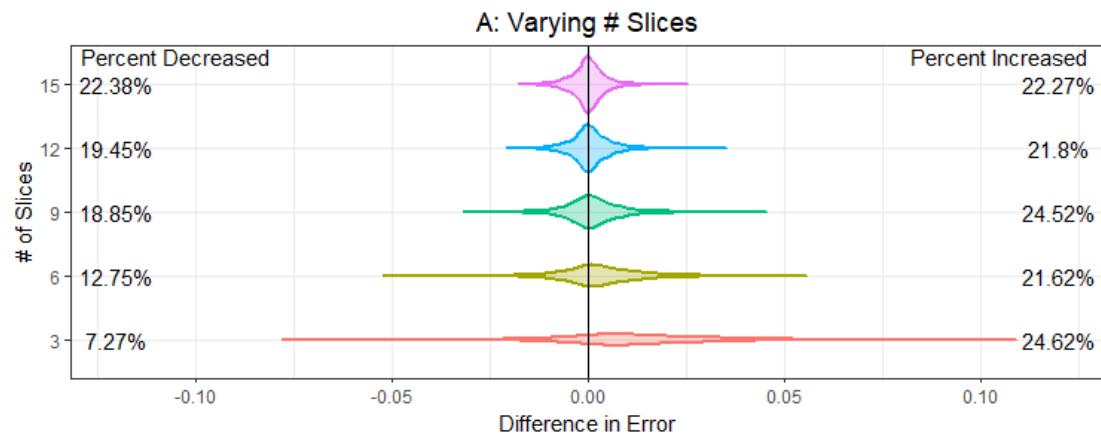

3B: Average Change in Run Time
