## Supplemental Figures

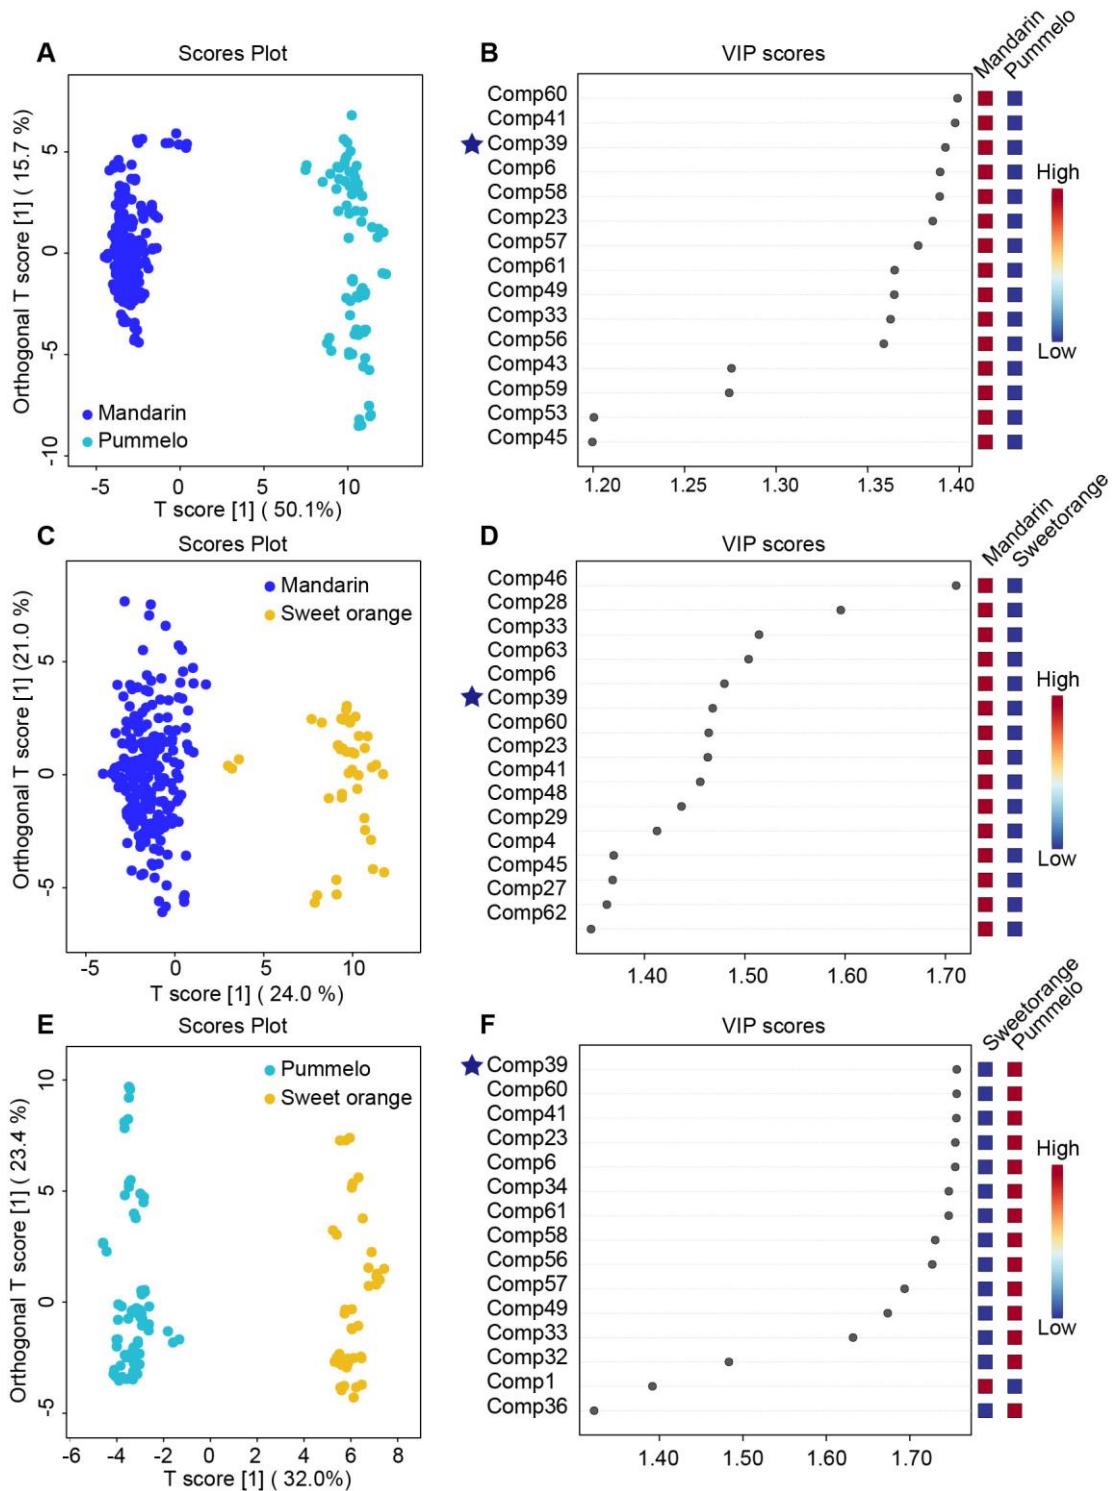

**Figure S1. Phylogenetic analysis of the 150 citrus accessions.**

Overview of the variance map (A) and population admixture analysis (B, C) of 150 citrus accessions based on the SNP dataset. (I) Chromosomes; (II) Gene density; (III) SNP density; (IV) InDel density; (V) SV density. The colored dots and lines indicate different citrus groups in the principal component analysis (B) and population admixture (C).

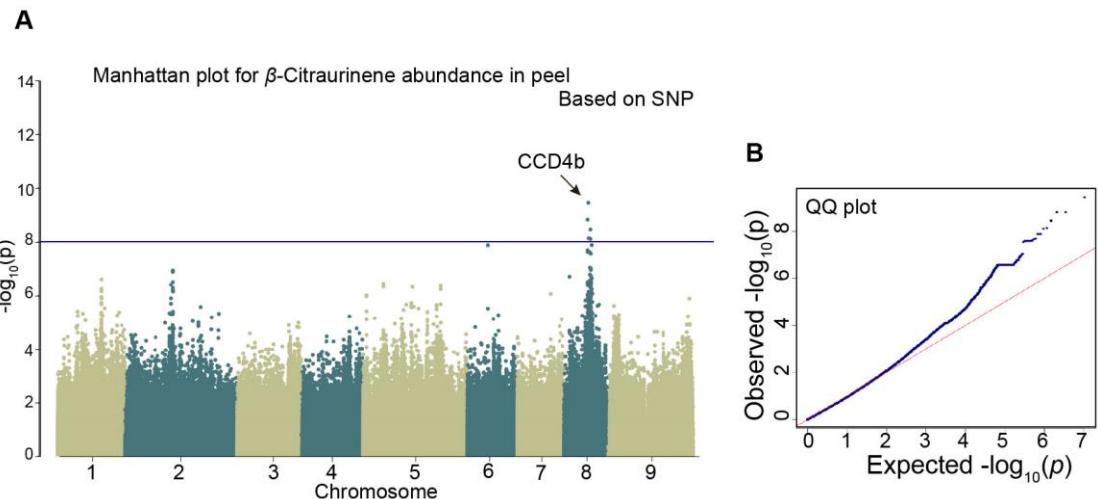

**Figure S2. Multivariate analysis of carotenoids and carotenoid derivatives.**

Principal component analysis (A) and partial least squares discriminant analysis (B) of carotenoids and carotenoid derivatives that accumulate in 148 citrus accessions.

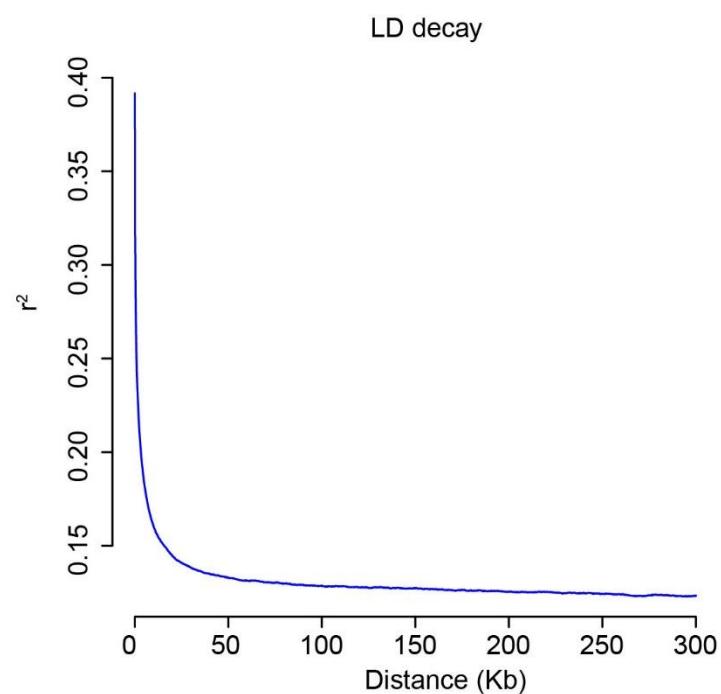

**Figure S3. Orthogonal PLS-DA of carotenoids and carotenoid derivatives among mandarin, pummelo, and sweet orange.**

Score plots (A, C, E) based on Orthogonal PLS-DA and top 15 variables (B, D, F) based on Component 1 (T score). The star indicates  $\beta$ -cryptoxanthin.

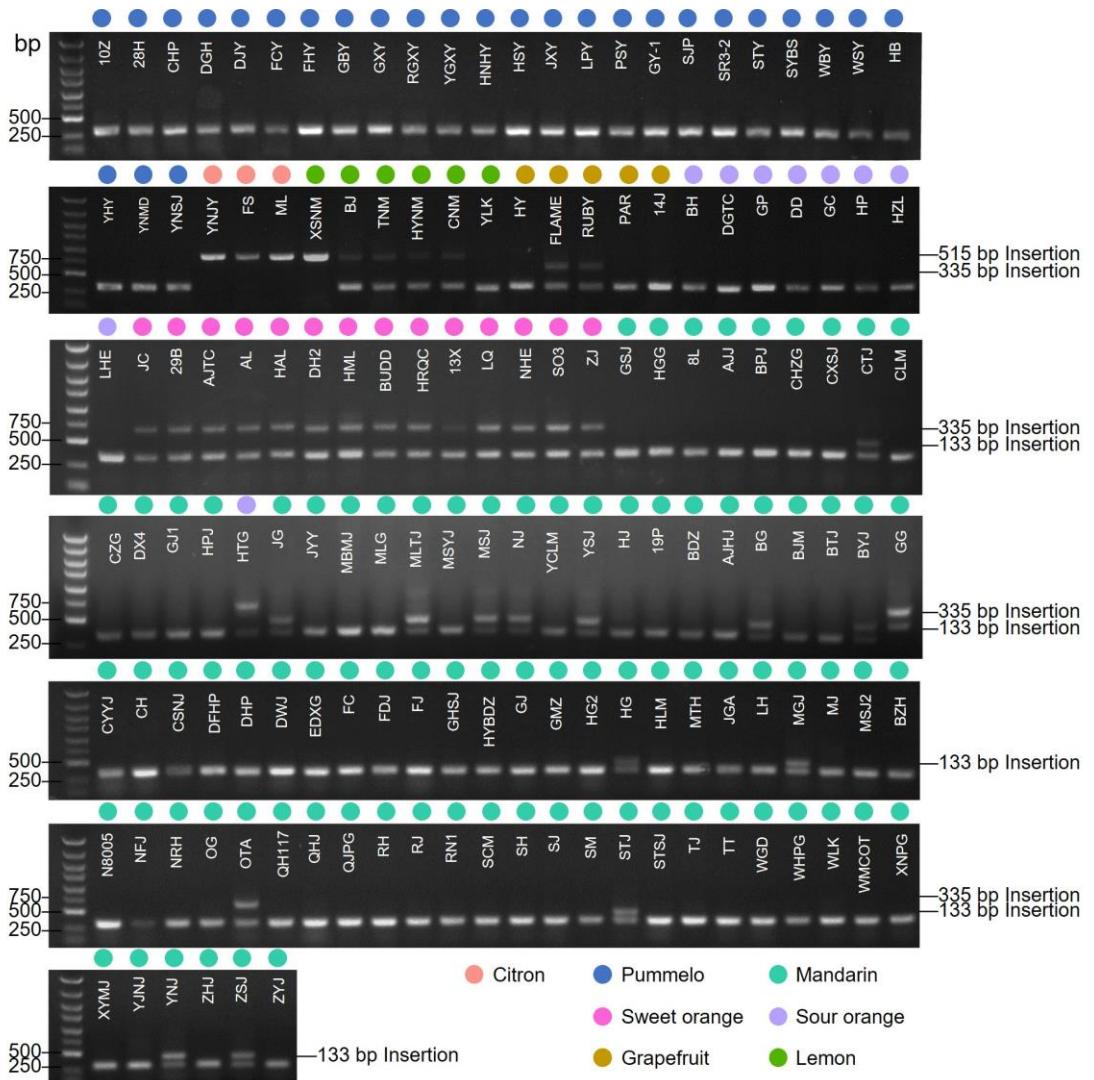

**Figure S4. Genome-wide association study for  $\beta$ -citraurinene.**

Manhattan plot (A) and QQ plot (B) of  $\beta$ -citraurinene abundance based on a SNP-GWAS for citrus peel.

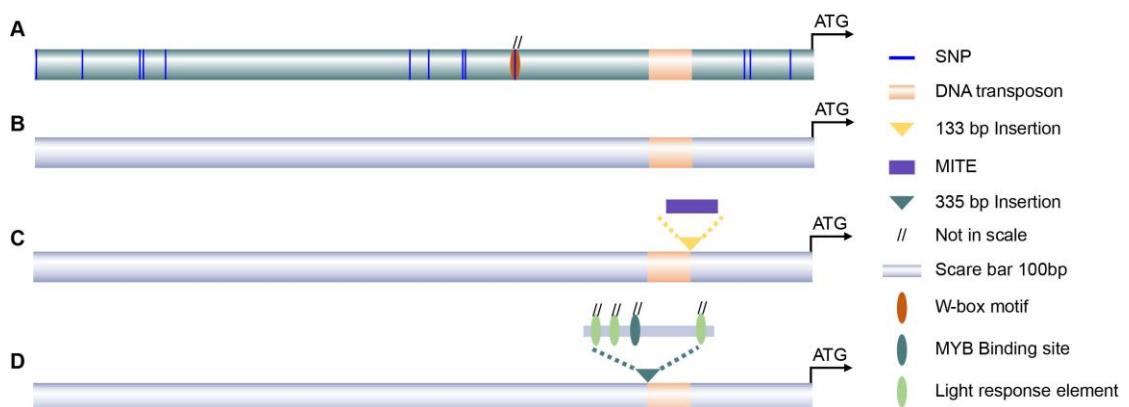

**Figure S5. Linkage disequilibrium (LD) decay in the studied population.**

LD level represented by  $r^2$  with physical distance in the whole population.

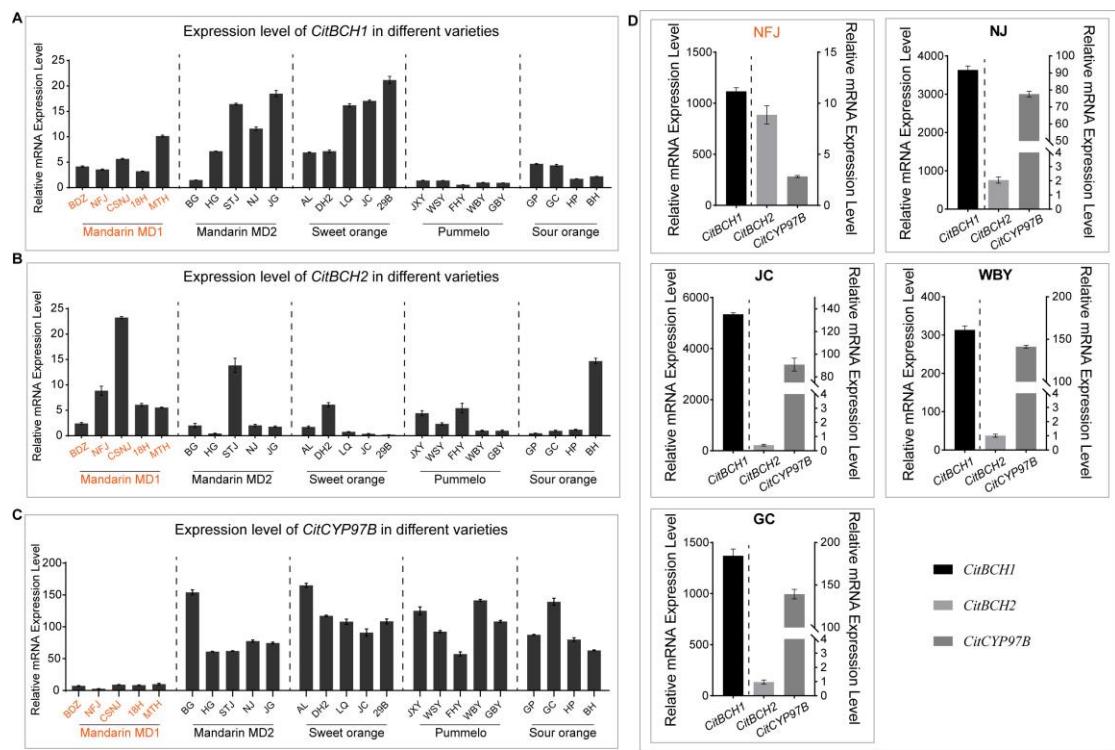

**Figure S6. Validation of structural variation using PCR-based markers.**

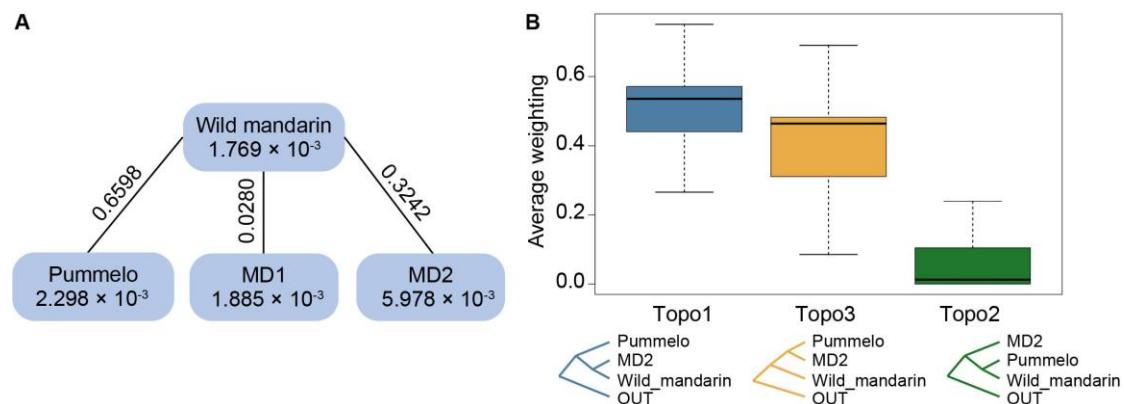

**Figure S7. Schematic of *CitCYP97B* promoter sequence variation.**

Schematic of *CitCYP97B* promoter sequence variation in Haplotype 1 (A), Haplotype 3 (B), Haplotype 4 (C), Haplotype 5 (D). The hooked arrow indicates the start site of transcription.

**Figure S8. The expression level of carotene hydroxylase genes in different citrus varieties.**

(A) The expression levels of *CitBCH1* in the pulp of mature citrus varieties. (B) The expression levels of *CitBCH2* in the pulp of mature citrus varieties. (C) The expression levels of *CitCYP97B* in the pulp of mature citrus varieties. (D) Comparison of the expression levels of carotene hydroxylase genes in different citrus varieties. The expression level of *CitBCH1* corresponds to the left Y-axis, and both the expression levels of *CitBCH2* and *CitCYP97B* correspond to the right Y-axis. Data are presented as mean values  $\pm$  standard error in triplicate. Orange font indicates the varieties that accumulate a high proportion of  $\beta$ -cryptoxanthin.

**Figure S9. Genetic diversity and introgression analysis of wild mandarin, cultivated mandarin MD2, and pummelo.**

Genetic diversity and population differentiation in the window containing *CitCYP97B* (A) and topology weighting of the 1-Mb region around *CitCYP97B* in wild mandarin, cultivated mandarin MD2, and pummelo (B). Rectangles represent the genetic diversity ( $\pi$ ) of citrus groups. Lines represent  $F_{ST}$  values between citrus groups.
