

A ISAG^{hi} T cells in familial tauopathy and EOAD

B Non-classical monocytes in familial tauopathy and EOAD

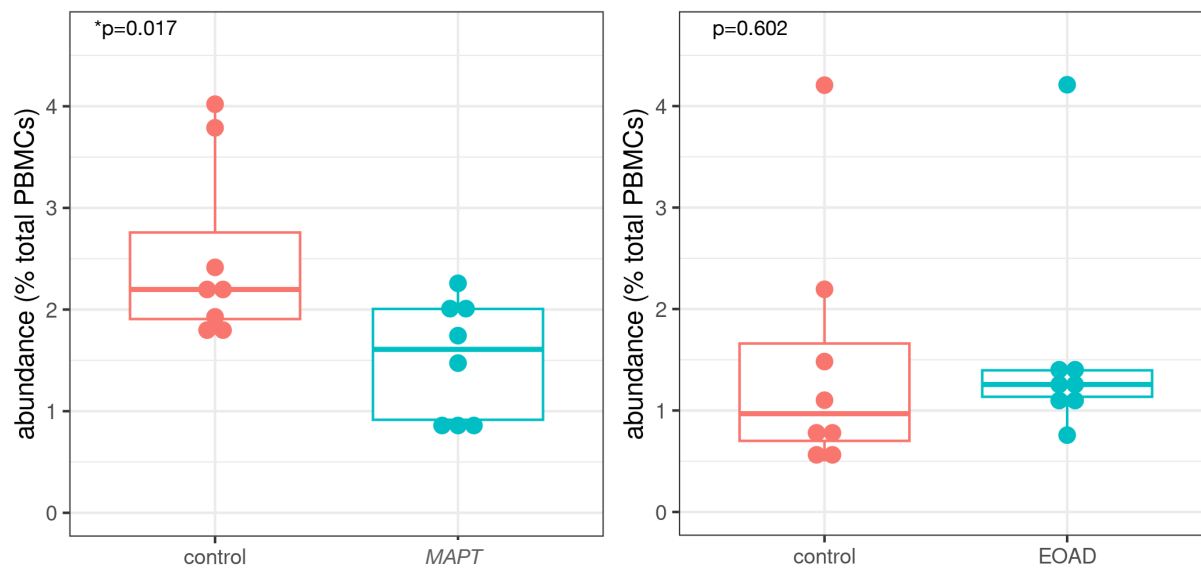

Figure S3. Analysis of changes in cell-type abundance in familial tauopathy and EOAD.

A, Analysis of changes in ISAG^{hi} T-cell abundance in the present study and an independent study focusing on familial tauopathy revealed a specific expansion in EOAD ($P = 0.005$). **B**, Similar analysis of changes in non-classical monocyte abundance revealed that the reduction in non-classical monocytes is specific to familial tauopathy ($P = 0.017$).
