Figs. S1 to S5

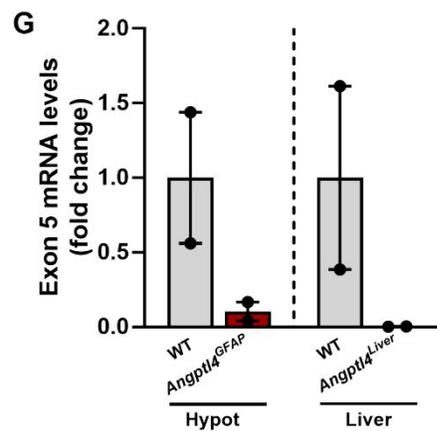

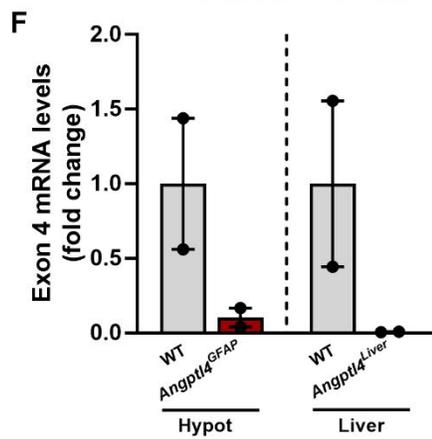

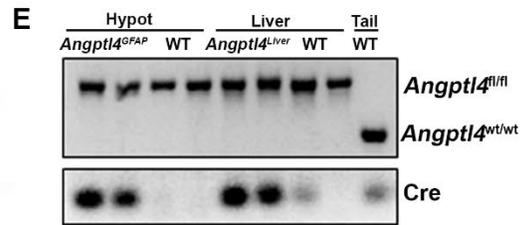

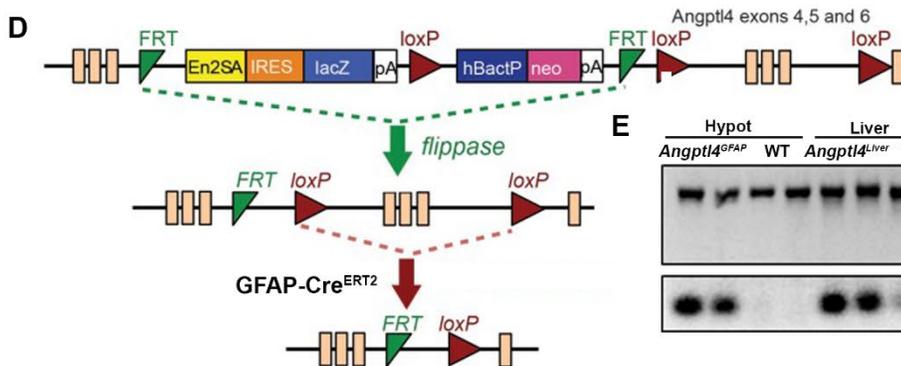

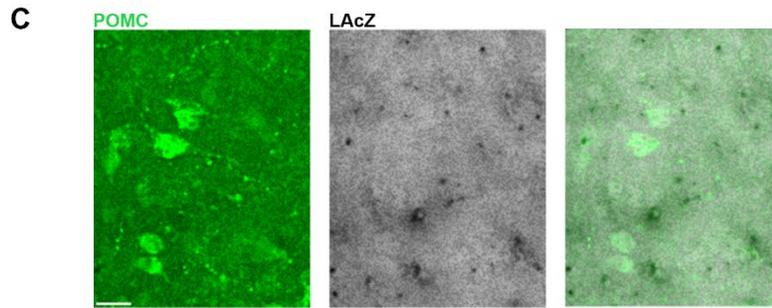

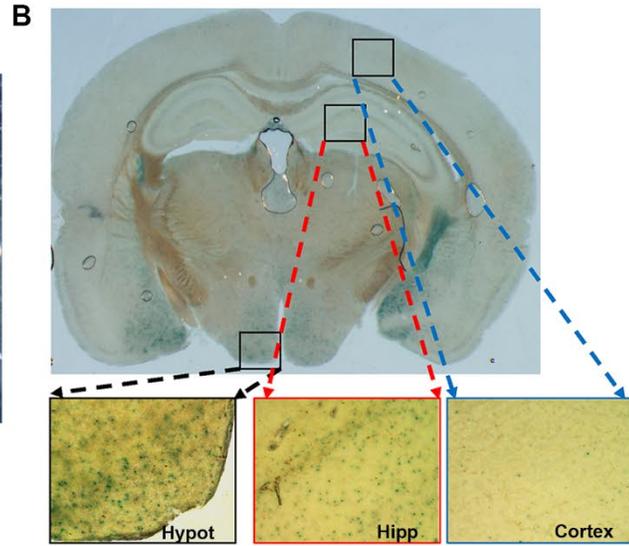

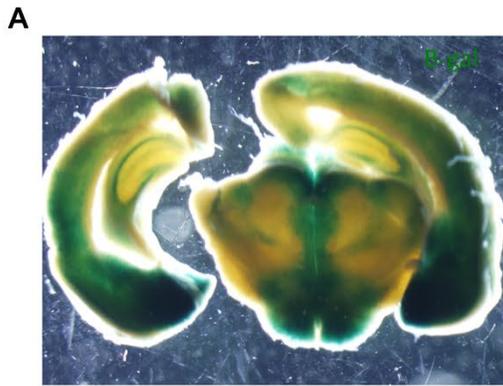

Fig. S1. *Angptl4* expression is downregulated in *Angptl4^{GFAP}* mice. (A) Low magnification image of LacZ staining in the brain (coronal section = 300 μ m). (B) High resolution image of LacZ expression in the brain (coronal section=50 μ m). Inserts show high magnification of three different areas of the brains (Hypot=hypothalamus, Hipp =Hippocampus). (C) Representative images showing lack of colocalization of POMC neurons and LacZ (scale bar = 20 μ m). (D) Schematic diagram illustrating the generation of astrocyte-specific ANGPTL4 (*Angptl4^{GFAP}*) mice. (E) PCR amplification of *Angptl4^{fl/fl}* mice displaying bands from both or none of the alleles floxed. As control, we show the PCR amplification bands from the liver of our previously reported mice loosing *Angptl4* specifically in liver (*Angptl4^{Liver}*). mRNA expression of *Angptl4* (F) exon 4 and (G) exon 5 from hypothalamus of WT and *Angptl4^{GFAP}*. As a positive control, we also show the mRNA expression in livers from our previously described *Angptl4^{Liver}* mice.

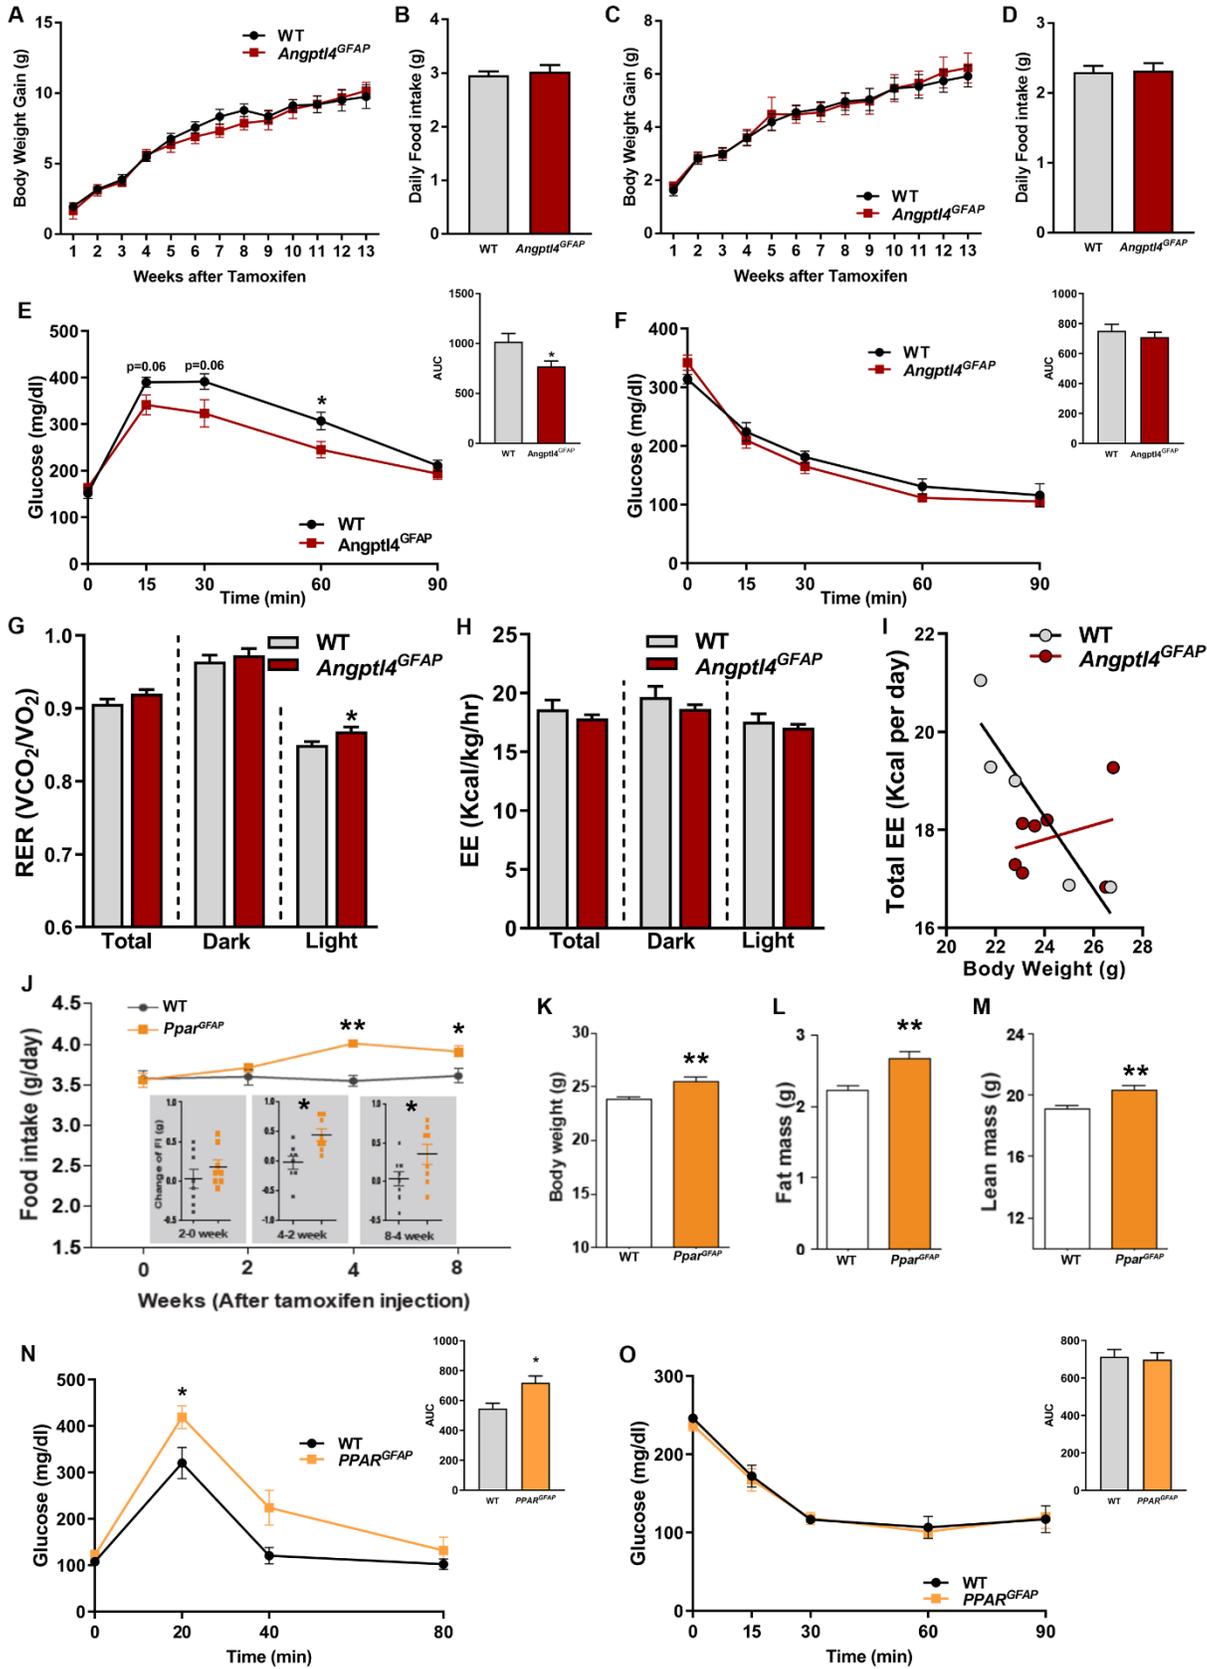

Fig. S2. Metabolic characterization of *Angptl4*^{GFAP} and *Ppar*^{GFAP} mice on chow diet. Body weight gain of *Angptl4*^{GFAP} (A) male and (C) female mice and their control littermates eating a chow diet (CD). Daily food intake of *Angptl4*^{GFAP} (B) male and (D) female mice and their controls eating a CD (males: n = 10/9 mice per group; females: 10/9 mice per group). (E) Glucose tolerance test (GTT) and AUC, and (F) Insulin tolerance test (ITT) and AUC in *Angptl4*^{GFAP} mice and their control littermates on CD (n = 9 mice per group). (G) RER and (H and I) Energy Expenditure of *Angptl4*^{GFAP} mice and their control littermates on CD (n = 5/7 mice per group). (J) Weekly food intake of *Ppar*^{GFAP} mice and their control littermates fed a CD. (K) Body weight, (L) Fat mass and (M) Lean mass of *Ppar*^{GFAP} mice and their control littermates fed a CD (n = 8 mice per group). (N) Glucose tolerance test and AUC, and (O) Insulin tolerance test and AUC in *Ppar*^{GFAP} mice and their control littermates fed a CD (n = 4/6 mice per group respectively). Data are presented as mean ± SEM. *p ≤ 0.05 and **p ≤ 0.01 as determined by two-tailed t-test.

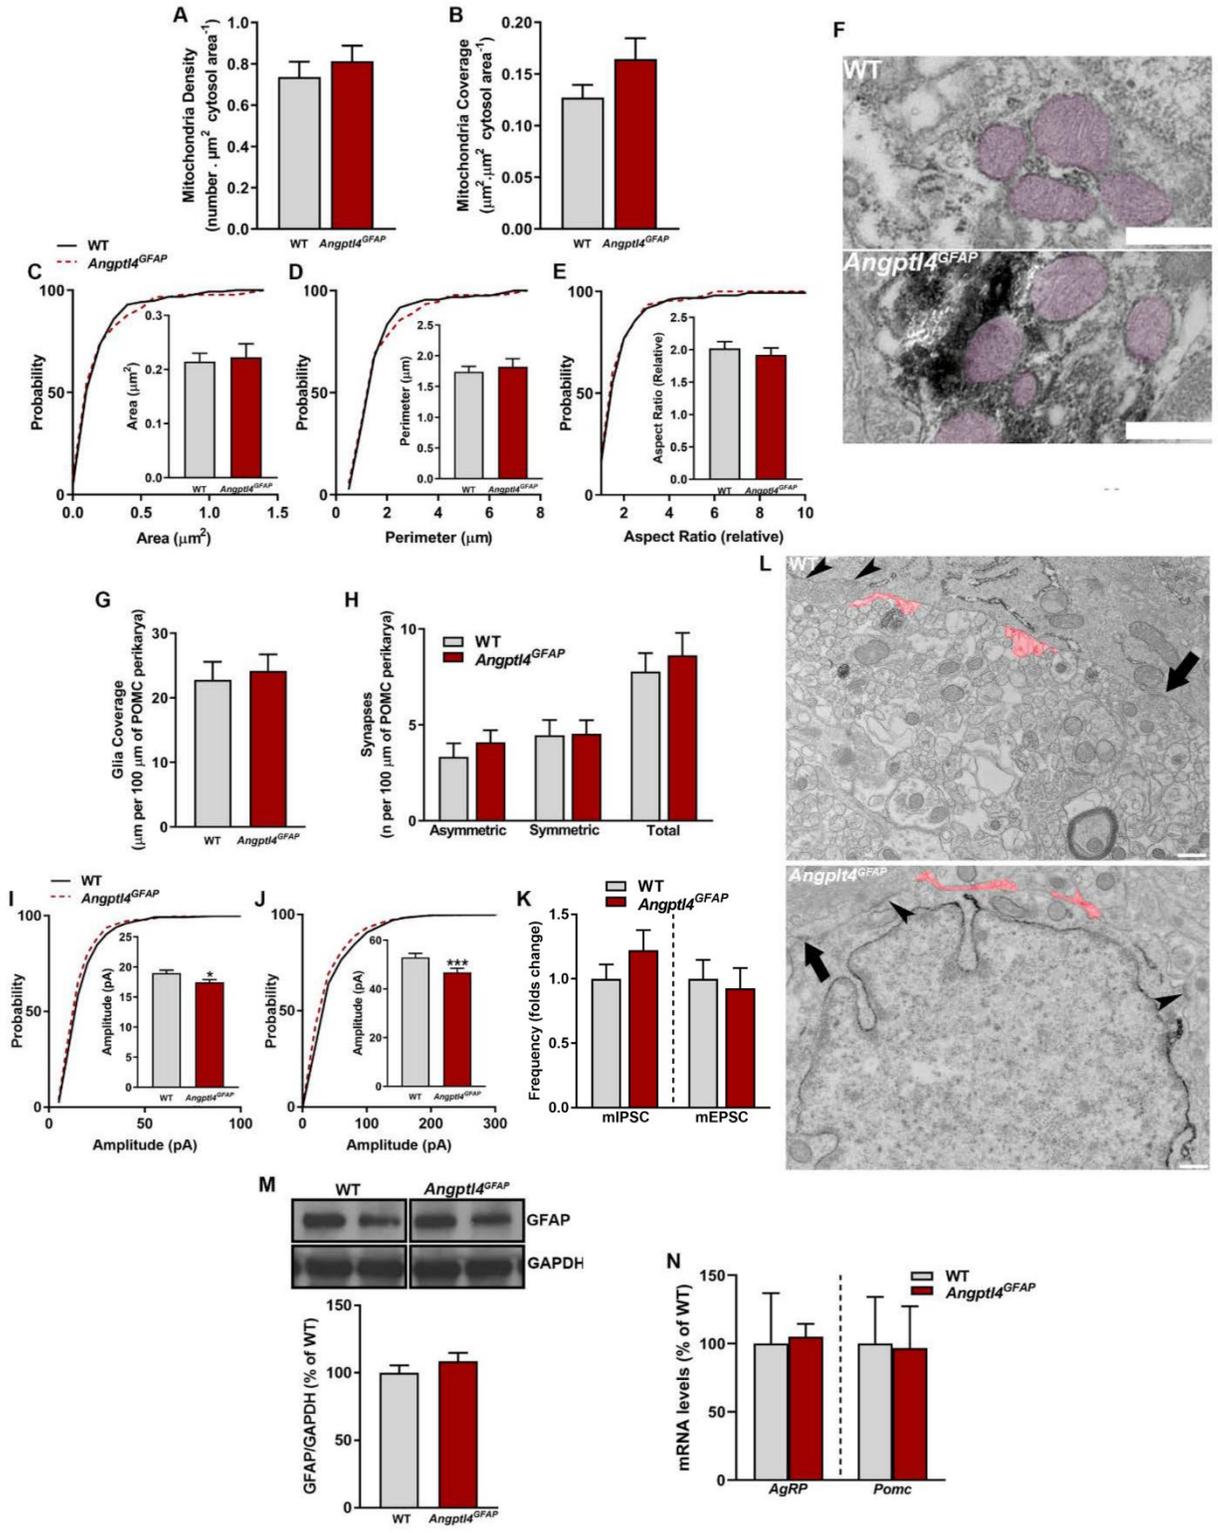

Fig. S3. Astrocytic Mitochondria morphology and synaptic events onto POMC neurons on *Angptl4*^{GFAP} mice on chow diet. Mitochondria (A) density and (B) coverage from MBH astrocytes of *Angptl4*^{GFAP} mice and their control littermates fed a chow diet (CD). Cumulative Distribution and mean of mitochondria (C) area, (D) perimeter and (E) aspect ratio from MBH astrocytes of *Angptl4*^{GFAP} mice and their control littermates fed a CD (n >90 mitochondria from >12 astrocytes from 4/5 mice per group respectively). (F) Representative electron micrographs from MBH astrocytes of *Angptl4*^{GFAP} mice and their control littermates fed a CD (scale bar=500nm). (G) Glia Coverage and (H) Number of synapses per 100µm of POMC perikarya of *Angptl4*^{GFAP} mice and their controls fed a CD (n = 15/21 neurons per group). Electrophysiological recordings showing the amplitude of (I) mIPSC and (J) mEPSC, and (K) frequency of mIPSC and mEPSC from POMC neurons of *ANGPTL4*^{GFAP} mice and their control littermates fed a chow diet (n = 18 cells from 4 mice per group). (L) Representative electron micrographs showing glia coverage and synaptic events onto the POMC perikarya of *Angptl4*^{GFAP} mice and their control littermates fed a chow diet. Red trace illustrates glia coverage. Arrowheads depict symmetric synapses. Arrows depict asymmetric synapses. (Scale bar=500nm). (M) Quantification and representative blots (from the same film) showing the levels of GFAP levels in the MBH of *Angptl4*^{GFAP} mice and their controls on chow diet (n = 5 mice per group respectively). (N) *AgRP* and *Pomc* mRNA levels in MBH of *Angptl4*^{GFAP} mice and their controls on CD. Data are presented as mean ± SEM. ***p≤ 0.001 as determined by two-tailed t-test or Kolmogorov-Smirnov test for analyses of cumulative distribution.

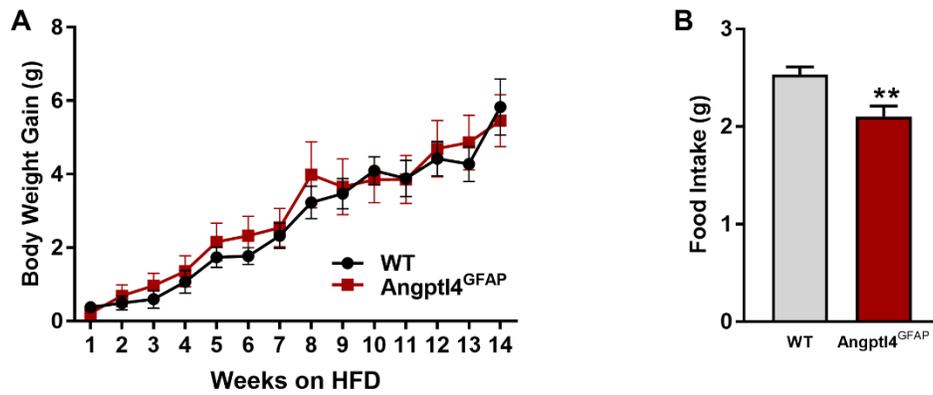

Fig S4. Metabolic phenotype of *Angptl4*^{GFAP} female mice during HFD treatment. (A) Weekly Body weight gain and (B) daily food intake of *Angptl4*^{GFAP} female mice and their control littermates during chronic exposure to HFD. Data are presented as mean \pm SEM. ** $p \leq 0.01$ as determined by two-tailed t-test

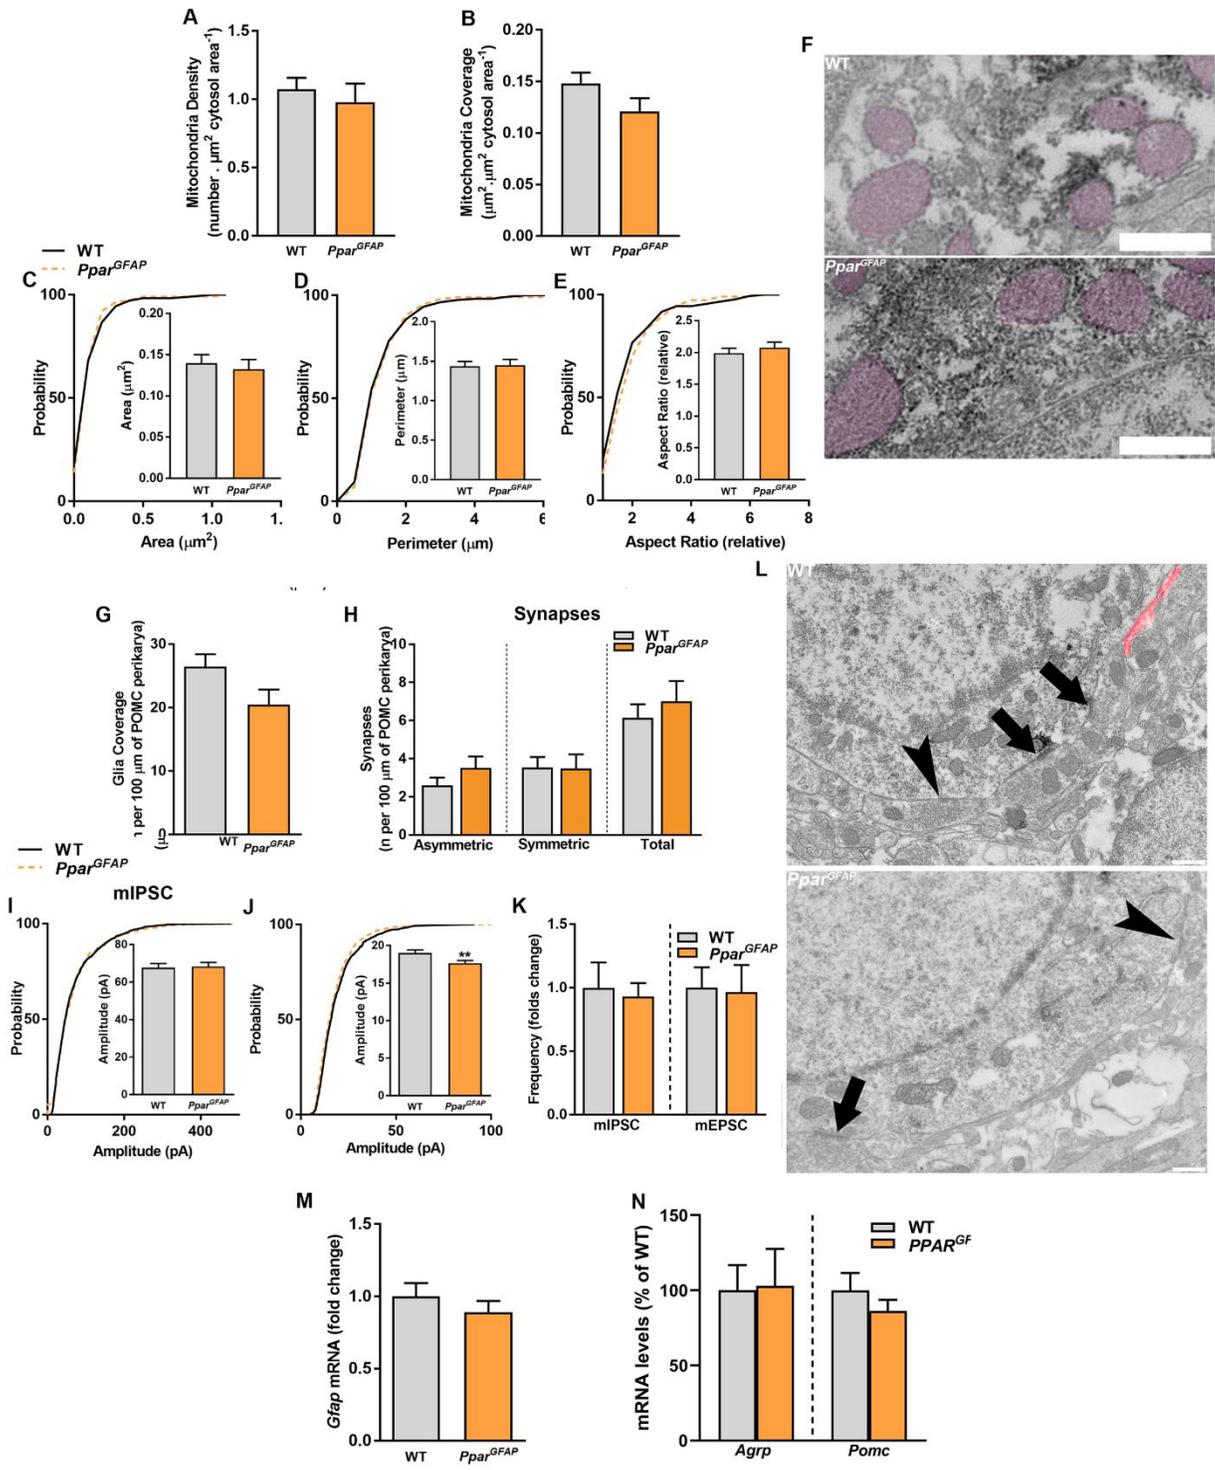

Fig. S5. Astrocytic Mitochondria morphology and synaptic events onto POMC neurons on *Ppar^{GFAP}* mice on chow diet. Mitochondria (A) density and (B) coverage from MBH astrocytes of *Ppar^{GFAP}* mice and their control littermates fed a chow diet (CD). Cumulative Distribution and mean of mitochondria (C) area, (D) perimeter and (E) aspect ratio from MBH astrocytes of *Ppar^{GFAP}* mice and their control littermates fed a CD (n > 114 mitochondria from >13 astrocytes from 4/3 mice per group respectively). (F) Representative electron micrographs from MBH astrocytes of *Ppar^{GFAP}* mice and their control littermates fed a CD (scale bar=500nm). (G) Glia Coverage and (H) Number of synapses per 100µm of POMC perikarya of *Ppar^{GFAP}* mice and their controls fed a CD (n = 24/18 neurons from 5/4 mice per group respectively). Electrophysiological recordings showing the amplitude of (I) mIPSC and (J) mEPSC, and (K) frequency of mIPSC and mEPSC from POMC neurons of *Ppar^{GFAP}* mice and their control littermates fed a chow diet (n = 16/15 neurons from 3 mice per group). (L) Representative electron micrographs showing glia coverage and synaptic events onto the POMC perikarya of *Ppar^{GFAP}* mice and their control littermates fed a chow diet. Red trace illustrates glia coverage. Arrowheads depict symmetric synapses. Arrows depict asymmetric synapses. (Scale bar=500nm). (M) *Gfap* mRNA levels in the MBH of *Ppar^{GFAP}* mice and their controls on CD (n = 4/5 mice per group respectively). (N) *AgRP* and *Pomc* mRNA levels in MBH of *Ppar^{GFAP}* mice and their controls on CD. Data are presented as mean ± SEM. **p ≤ 0.01 as determined by two-tailed t-test or Kolmogorov-Smirnov test for analyses of cumulative distribution.
