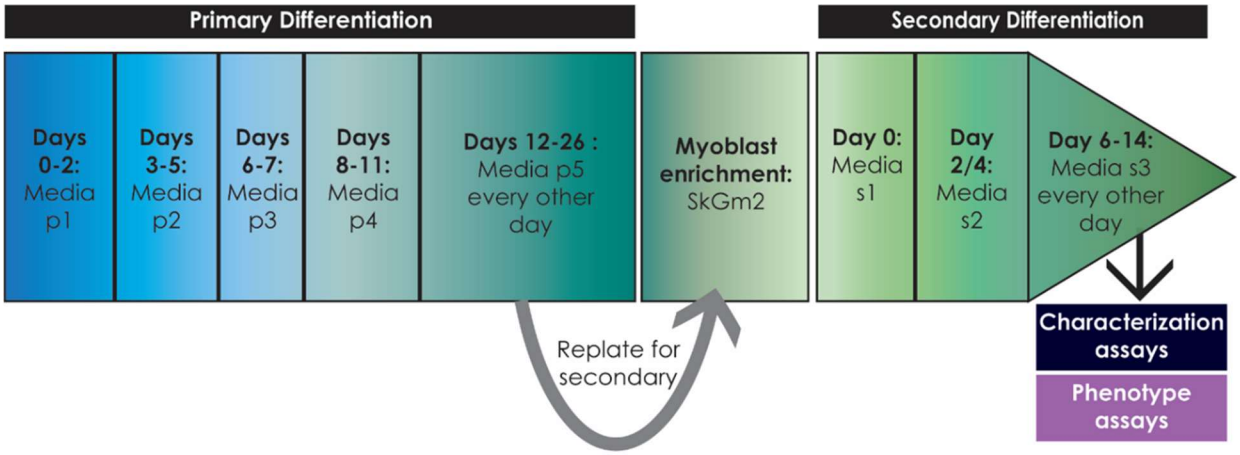

Fig. S2. iSkM differentiation schematic. iPSCs were plated at a desired seeding density and differentiated into myotubes using a two-stage differentiation protocol. Primary differentiation uses a series of five medias to modulate Wnt and BMP signaling to form paraxial mesoderm progenitors and myoblasts. Cells were then replated and enriched for myoblasts. Enriched myoblasts cultures underwent secondary differentiation to form spontaneously contracting myotubes which were then used for endpoint assays.

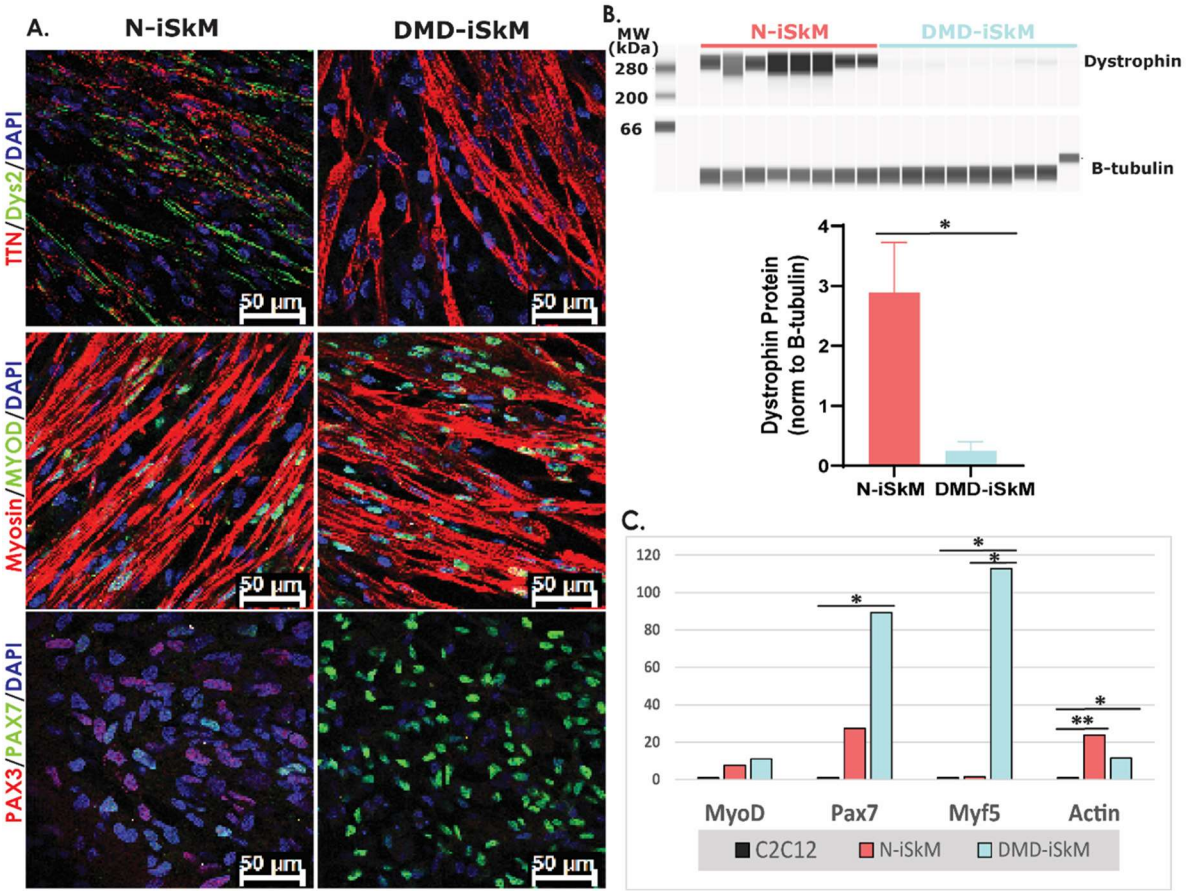

Fig. S4. Characterization of CTRL and DMD iSkMs. A) Differentiated myotubes express normal skeletal muscle markers after secondary differentiation (scale bar = 50 microns). **B)** DMD iSkMs are dystrophin deficient after secondary differentiation as shown by capillary western (p-value = 0.0131). **C)** *MyoD*, *Pax7*, *Myf5*, and *Actin* transcript expression was evaluated by qPCR in CTRL and DMD iSkMs using C2C12s as a control. *Gapdh* was utilized for normalization. Table S6. RNA sequencing analysis and differential expression data of B10-mdx vs B10-WT mice at 6 months of age. Raw reads were mapped to chromosomes and gene identifiers and subsequent differential analysis was completed (n = 5 per group).
