

**Supplemental information**

**Alterations of lipid homeostasis in morbid**

**obese patients are partly reversed**

**by bariatric surgery**

**Flore Sinturel, Simona Chera, Marie-Claude Brulhart-Meynet, Jonathan Paz Montoya, Etienne Lefai, François R. Jornayvaz, Giovanni D'Angelo, Minoa Karin Jung, Zoltan Pataky, Howard Riezman, and Charna Dibner**

**Figure S1: Comparison of differentially abundant serum lipids measured in obese individuals before and after bariatric surgery, Related to Figure 1.**

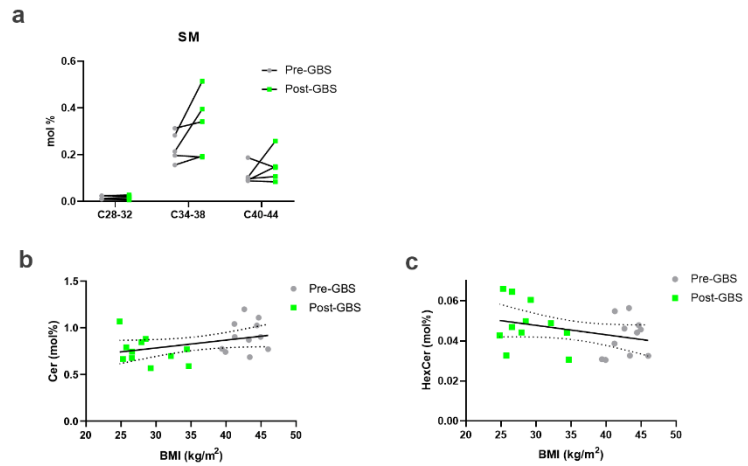

**(a)** Relative PC level changes (mol%) in sera collected before and after GBS, clustered according to the chain length. LC (long chain C28-34), VLC (very long chain C38-44).

**(b)** Relative PC level changes (mol%) in sera collected before and after GBS, represented according to the class of saturation degree: saturated fatty acids (SFA), monounsaturated fatty acids (MUFA) and polyunsaturated fatty acids (PUFA).

**(c-d)** Relative PC **(c)** and PE **(d)** level changes (mol%) in sera collected before and after GBS, clustered according to the degree of saturation.

**(e)** Relative PE level changes (mol%) in serum collected before and after GBS, represented according to the nature of the fatty acid linkage (diacyl vs alkyl-acyl (ether) or monoacyl (lyso)).

Statistics for **(c-e)** are paired student's *t*-test. Data for serum (n = 11) pre-GBS and post-GBS are represented as mean  $\pm$  SEM. \* p < 0.05; \*\* p < 0.01.

**Figure S2: Comparison of differentially abundant SAT lipids measured in obese individuals before and after bariatric surgery, Related to Figure 2.**

(a) Relative SM level changes (mol%) in sera collected before and after GBS (n = 5), represented according to the chain length. Data are represented as mean  $\pm$  SEM.

(b-c) Association between the relative levels of ceramides (b), or HexCer (c) detected in sera, and the BMI of the subjects before and after GBS (n = 22, Spearman correlation, for the ceramides  $R = 0.334$ ,  $p = 0.1291$ , for the HexCer,  $R = -0.237$   $p = 0.289$ ).

## Tables

**Table S1. Participant characteristics (cohort 1), Related to STAR Methods.**

|  | Pre GBS (n = 11) |              |          | Post GBS (n = 11) |              |          |                  |

M = male, F= female. LDL: low-density lipoprotein cholesterol. HDL: high-density lipoprotein cholesterol. hs-CRP: high sensitivity C-reactive protein. Normally distributed data are presented as means  $\pm$  SD; non-normally distributed data are presented as medians (25<sup>th</sup> - 75<sup>th</sup> percentile). Group differences were assessed with the Wilcoxon matched-pairs signed-rank test.
