
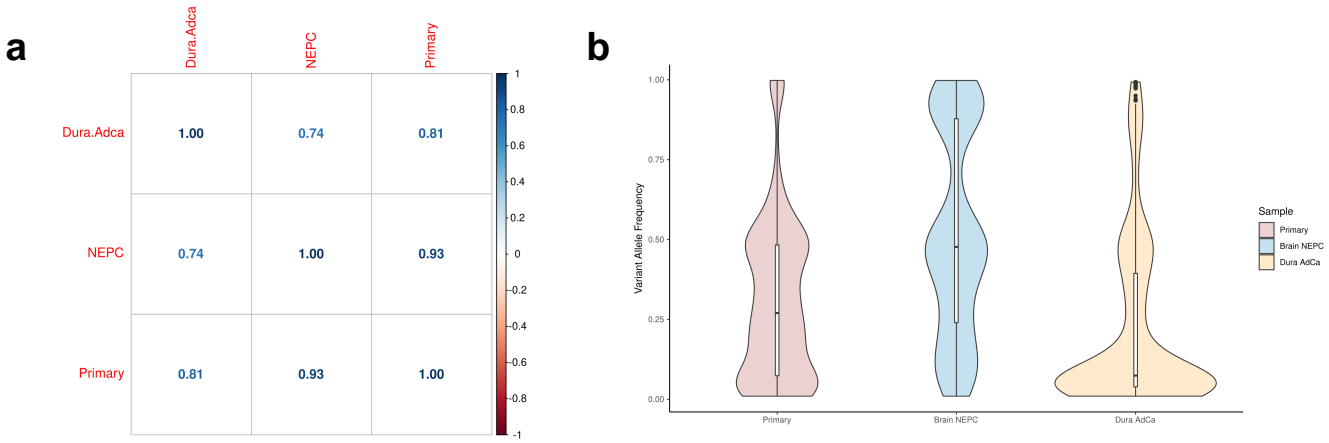
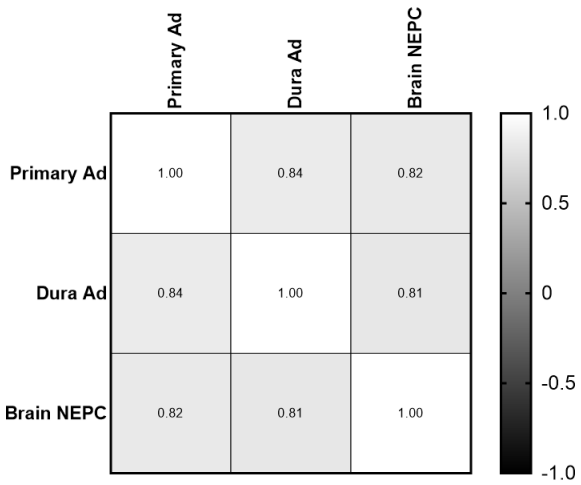
Supplementary Fig 1. a) Pearson correlation of variant allele frequencies for variants shared across all samples. P-values for all comparisons were < 0.0001. Variants plotted based on allele frequencies between **b)** primary prostate and dural adenocarcinoma, **c)** primary prostate and brain NEPC or **d)** brain NEPC and dural adenocarcinoma. Shared variants are noted in black, and those unique to a sample colored for primary prostate (red), dura adenocarcinoma (yellow) and brain NEPC (blue).

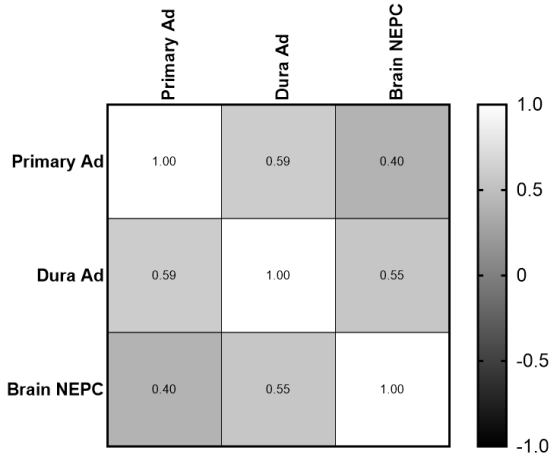


Supplementary Fig 2. a) Pearson correlation of depth of coverage for variants shared for all samples. P-values for all comparisons were < 0.0001. **b)** Violin plot of all variants that passed filters (read depth ≥ 50, allele frequence ≥ 0.01, and Mutect2 PASS) for each sample.

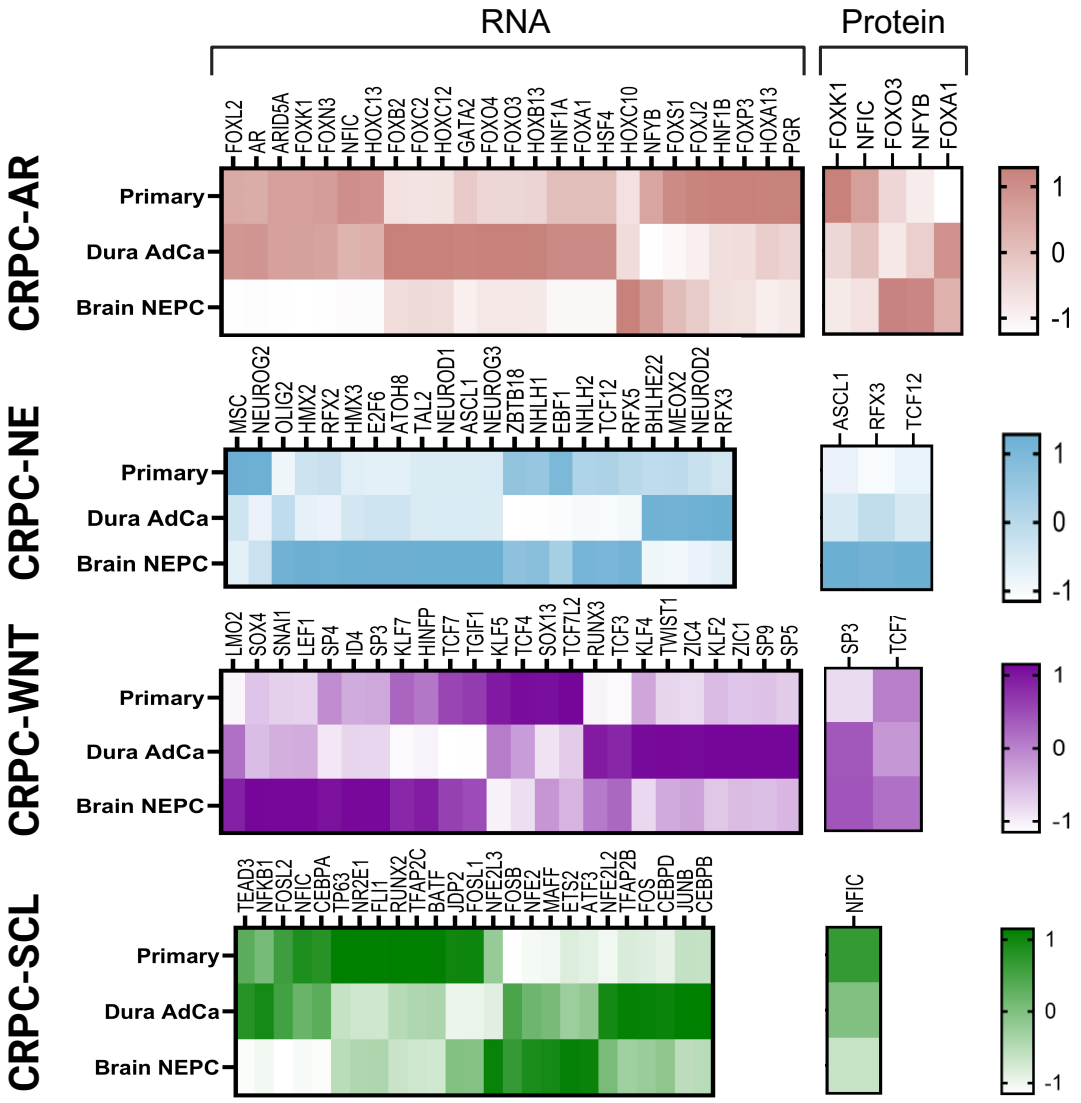
a Spearman correlation of transcriptome



b Spearman correlation of proteome



Supplementary Fig 3. Spearman correlation of transcriptome **(a)** or proteome **(b)** for genes shared across all samples. P-values for all comparisons for a and b are <0.0001.



Supplementary Fig 4. Heatmap of transcription factor expression regulating the four CRPC subtypes as indicated for the transcriptome (left) and proteome (right).

Supplementary Table 1. Genomic mutations with read depth ≥50, allele frequency ≥0.01, and passed Mutect2 filter.
