Table 1 - UK Biobank field references

Field reference	Label	Comments
eid	Participant identifier	
21003	Age when attended assessment centre	
31	Sex	
53	Date of attending assessment centre	
189 / 22189	Townsend deprivation index	This field was revised during the course of our analysis in favour of indices of multiple deprivation. We retained the original value for our analysis.
2100	Body mass index	
20160	Ever smoked	
4598	Ever depressed for a whole week	
1568	average weekly red wine intake	Used to derive average total weekly units of alcohol
1578	average weekly champagne white wine	
1588	average weekly beer plus cider intake	
1598	average weekly spirits intake	
1608	average weekly fortified wine intake	
4407	average monthly red wine intake	
4418	average monthly champagne plus white wine intake	
4429	average monthly beer plus cider intake	
4440	average monthly spirits intake	
4451	average monthly fortified wine intake	
4462	average monthly intake of other alcoholic drinks	
5364	average weekly intake of other alcohol	
22032	International physical activity questionnaire activity group	
20016	Fluid intelligence score	
20023	Reaction time mean time to correctly identify matches	
20018	Prospective memory result	
4282	Numeric memory maximum digits remembered correctly	
6348	Duration to complete numeric path trail (TMTA)	
6350	Duration to complete alphanumeric path trail (TMTB)	
20197	Paired associate learning number of word pairs correctly associated	
23323	Number of symbol digit matches attempted	Used to derive mean symbol digit matches
23324	Number of symbol digit matches made correctly	Used to derive mean symbol digit matches
25781	Volume of white matter hyperintensities	

Association between surgical admissions, cognition, and neurodegeneration in older people: UK Biobank population-based study – Supplementary Material

Field reference	Label	Comments
25019	Volume of hippocampus left	
25020	Volume of hippocampus right	
20001	Cancer code self-reported	Used to determine leukaemia, lymphoma, solid tumour.
20002	Non cancer code self-reported	Used to derive medical history. 1065 hypertension; 1220 diabetes.
41200	Operative procedures main OPCS 4	Used to derive surgeries
41202	Diagnoses main ICD10	Used to derive hospital admissions
41270	Diagnoses (all) ICD10	Used to determine 'ever dementia'
27174	Mean thickness of caudalanteriorcingulate (left hemisphere)	Used to derive average DKT regions
27267	Mean thickness of caudalanteriorcingulate (right hemisphere)	
27175	Mean thickness of caudalmiddlefrontal (left hemisphere)	
27268	Mean thickness of caudalmiddlefrontal (right hemisphere)	
27176	Mean thickness of cuneus (left hemisphere)	
27269	Mean thickness of cuneus (right hemisphere)	
27177	Mean thickness of entorhinal (left hemisphere)	
27270	Mean thickness of entorhinal (right hemisphere)	
27178	Mean thickness of fusiform (left hemisphere)	
27271	Mean thickness of fusiform (right hemisphere)	
27179	Mean thickness of inferiorparietal (left hemisphere)	
27272	Mean thickness of inferiorparietal (right hemisphere)	
27180	Mean thickness of inferiortemporal (left hemisphere)	
27273	Mean thickness of inferiortemporal (right hemisphere)	
27204	Mean thickness of insula (left hemisphere)	
27297	Mean thickness of insula (right hemisphere)	
27181	Mean thickness of isthmuscingulate (left hemisphere)	
27274	Mean thickness of isthmuscingulate (right hemisphere)	
27182	Mean thickness of lateraloccipital (left hemisphere)	
27275	Mean thickness of lateraloccipital (right hemisphere)	
27183	Mean thickness of lateralorbitofrontal (left hemisphere)	
27276	Mean thickness of lateralorbitofrontal (right hemisphere)	
27184	Mean thickness of lingual (left hemisphere)	
27277	Mean thickness of lingual (right hemisphere)	
27185	Mean thickness of medialorbitofrontal (left hemisphere)	
27278	Mean thickness of medialorbitofrontal (right hemisphere)	
27186	Mean thickness of middletemporal (left hemisphere)	
27279	Mean thickness of middletemporal (right hemisphere)	
27188	Mean thickness of paracentral (left hemisphere)	
27281	Mean thickness of paracentral (right hemisphere)	
27187	Mean thickness of parahippocampal (left hemisphere)	
27280	Mean thickness of parahippocampal (right hemisphere)	
27189	Mean thickness of parsopercularis (left hemisphere)	
27282	Mean thickness of parsopercularis (right hemisphere)	
27190	Mean thickness of parsorbitalis (left hemisphere)	
27283	Mean thickness of parsorbitalis (right hemisphere)	
27191	Mean thickness of parstriangularis (left hemisphere)	
27284	Mean thickness of parstriangularis (right hemisphere)	
27192	Mean thickness of pericalcarine (left hemisphere)	
27285	Mean thickness of pericalcarine (right hemisphere)	
27193	Mean thickness of postcentral (left hemisphere)	
27286	Mean thickness of postcentral (right hemisphere)	
27194	Mean thickness of posteriorcingulate (left hemisphere)	
27287	Mean thickness of posteriorcingulate (right hemisphere)	
27195	Mean thickness of precentral (left hemisphere)	
27288	Mean thickness of precentral (right hemisphere)	
27196	Mean thickness of precuneus (left hemisphere)	
27289	Mean thickness of precuneus (right hemisphere)	
27197	Mean thickness of rostralanteriorcingulate (left hemisphere)	
27290	Mean thickness of rostralanteriorcingulate (right hemisphere)	

Association between surgical admissions, cognition, and neurodegeneration in older people: UK Biobank population-based study – Supplementary Material

Field reference	Label	Comments
27198	Mean thickness of rostralmiddlefrontal (left hemisphere)	
27291	Mean thickness of rostralmiddlefrontal (right hemisphere)	
27199	Mean thickness of superiorfrontal (left hemisphere)	
27292	Mean thickness of superiorfrontal (right hemisphere)	
27200	Mean thickness of superiorparietal (left hemisphere)	
27293	Mean thickness of superiorparietal (right hemisphere)	
27201	Mean thickness of superiortemporal (left hemisphere)	
27294	Mean thickness of superiortemporal (right hemisphere)

27295	Mean thickness of supramarginal (right hemisphere)	
27203	Mean thickness of transversetemporal (left hemisphere)	
27296	Mean thickness of transversetemporal (right hemisphere)	

Cognitive outcomes

Primary cognitive outcomes were reaction time, fluid intelligence, and prospective memory tests collected at Instance-0 (baseline), Instance-2 and Instance-3. As we did not have an *a priori* hypothesis that a specific cognitive domain would be vulnerable to surgery, we analysed each test individually, expecting convergent results across all three tests. All cognitive tests included in this analysis were conducted on supervised kiosks at assessment centres, usually after health questionnaires and prior to interview. All cognitive tests included in this analysis were conducted on supervised kiosks at assessment centres, usually after health questionnaires and prior to interview. The reaction time (Snap) test is a test of simple processing speed, measuring the mean duration in milliseconds until the button is pressed in rounds with correct paired matches. The fluid intelligence raw score is an unweighted sum of correct answers out of 13 language and mathematics questions. The prospective memory (Shape) test is a memory and inhibition test, the results of which we dichotomised as either correct on first attempt or not. Numeric memory raw score is the maximum digits remembered correctly in 12 rounds. Introduced from 2016, TMTA and TMTB raw scores use the duration to complete the pathway in deciseconds. The symbol digit substitution score was the mean number of correct matches. Paired associate learning was the number of word pairs correctly associated of 12 word-pairs.

Brain imaging outcomes

Brain imaging was performed at UK Biobank assessment centres using a standard Siemens Skyra 3T running VD13A SP4 (as of October 2015), with a standard Siemens 32-channel RF receive head coil in accordance with UK Biobank imaging acquisition protocols.^{1, 2} Brain imaging data used in this analysis was T1-weighted structural imaging 1x1x1 mm resolution with a 208x256x256 matrix field of view from a 5-minute 3D MPRAGE sagittal scan with in-plane acceleration iPAT=2 and pre-scan normalisation. T2-weighted FLAIR structural imaging had 1·05x1x1 mm resolution, 192x256x256 matrix field of view from a 6-minute 3D SPACE, sagittal scan with in-plane acceleration iPAT=2, partial Fourier = 7/8, fat saturation, elliptical k-space scanning and pre-scan normalization.

We used two primary brain imaging outcomes pre-processed by UK Biobank. Volume of white matter hyperintensities (from T1 and T2 fluid attenuated inversion recovery [FLAIR] images); and the average volume of left and right hippocampi (from T1 structural brain MRI, subcortical volumes [Oxford Centre for Functional Magnetic Resonance Imaging of the Brain (FMRIB) Integrated Registration and Segmentation (FIRST) tool,³]. These variables were selected due to known associations with dementia and cognition.⁴⁻⁷ Units were cubic

millimetres as outcome/dependent variables and z-scored using Instance-2 (imaging baseline) means and standard deviations as independent variables.

Secondary brain imaging outcomes were generated by UK Biobank using FreeSurfer image analysis suite⁸ from T1 structural volumes with parcellation of the white surface using the Desikan-Killiany-Tourville (DKT31) cortical labelling protocol.^{9, 10} We averaged the mean thicknesses of the 31 regions across hemispheres and adjusted type-3 p-values using false discovery rate (FDR) correction for multiple comparisons.

Primary exposure and risk factors

As previously,¹¹ two clinicians categorised surgical severity/complexity as minor, intermediate, major, major plus, complex major operation, or excluded (such as diagnostic day procedures), using the National Health Service medical record main procedure code (OPCS-4) and BUPA Schedule of Procedures as at 15 June 2022. Cumulative surgeries were calculated as the sum of eligible procedures dated between eight years prior to baseline Instance-0 date of assessment (~1998) up to date of assessment of the respective instance. Hospital admissions were calculated using ICD10 main diagnosis codes. stroke (I61, I62, I63, I64, I66); and other medical admissions (not stroke).

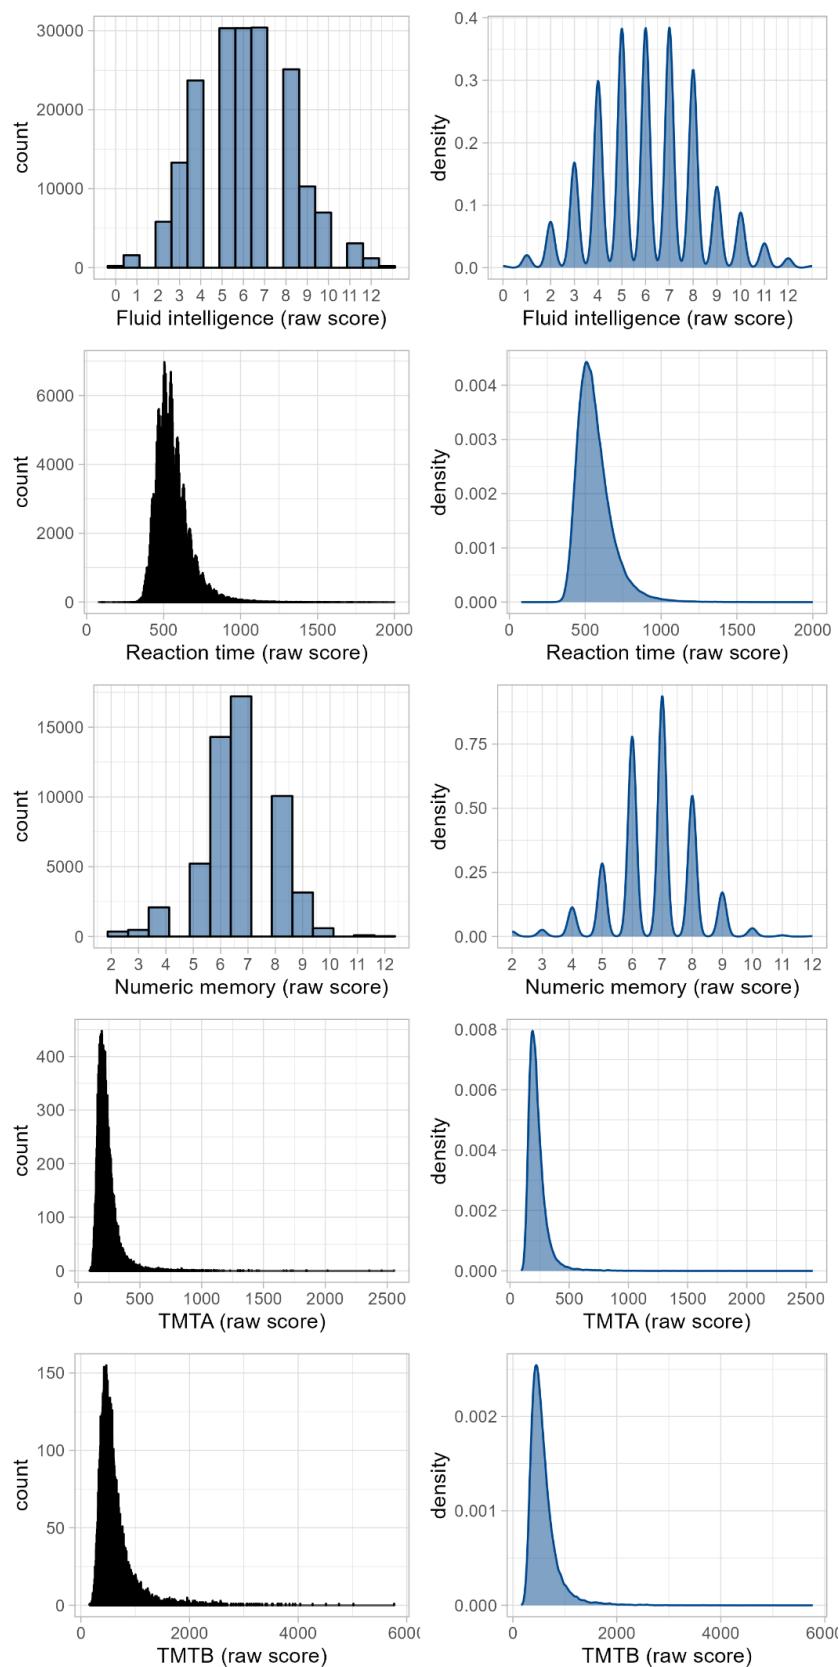

Age was defined as age at Instance-0 and time as the duration in years from Instance-0 to the relevant assessment date. Risk factors for dementia (as identified by the Lancet Commission¹²) were tested as covariates, including education, alcohol consumption, hypertension, hearing difficulty, smoking, body mass index (BMI), depression, physical activity, and diabetes. We did not attempt to derive air pollution, head injury or social contact, although controlled for stroke hospital admissions. Leukaemia, lymphoma, and solid tumours were also included as covariates consistent with the Charlson index. Deprivation was calculated at Instance-0 using the Townsend deprivation index, based on previous national census data assessing unemployment, non-car ownership, non-home ownership, and overcrowding based on postcode. Data were not imputed, although history of smoking or depression were dichotomised as “yes” or “no/null”. Alcohol consumption was measured using the number of standard alcohol units consumed per week. Physical activity used the International Physical Activity Questionnaire activity group classification and history of hypertension, diabetes and solid tumour were obtained from self-reported medical history collected at interview.

Dementia-ever was defined using International Classification of Diseases version 10 (ICD10) codes. F00, F000, F001, F002, F009, G30, G300, G301, G308, G309, F01, F010, F011, F012, F013, F018, F019, I673, F020, G310, A810, F021, F022, F023, F024, F106, F02,

F028, F03, F051, G311, and G318. Stroke hospital admissions were derived using ICD10 main diagnosis codes. I61, I62, I63, I64, I66. Other medical admissions were derived as 'not stroke'.

Sensitivity analyses included comparison of these models across stroke/no stroke data subsets, and clinical change in cognition categorised as 1-2 standard deviations from baseline. Exploratory stratification analysis also tested surgeries into one of four groups. 0; 1-2; 3-5; and 6+ surgeries.

¹CI = Confidence Interval; OR = Odds Ratio; TMTA = trail making test A; TMTB = trail making test B; SDST = symbol digit substitution. All available data were used across instances 0, 2, 3. All p<0·0001 unless indicated.

²All models were linear mixed effects models of all available data. Foundation models were minimally adjusted. cognitive outcome ~ surgeries + age + age² normalised/1000 + time + female sex + (1|participant).

³Fully adjusted models were cognitive outcome ~ surgeries + cumulative stroke admissions + cumulative other medical admissions + age + age² normalised + time*deprivation + female sex + education + body mass index + body mass index² normalised + smoking + depression + alcohol consumption + physical activity + hypertension + diabetes + solid tumour + (1|participant). Quadratic terms normalised by variable² / 1000. Interaction for surgeries*other medical admissions and time*deprivation included in reaction time, fluid intelligence and prospective memory fully adjusted models. Linear smoothing uses the formula, y ~ x + I(x²). Cumulative surgical procedures calculated from 8 years prior to baseline (instance 0).

¹CI = confidence interval; OR = odds ratio; TMTA = trail making test A; TMTB = trail making test B; SDST = symbol digit substitution. All p<0·0001 unless indicated.

²All available raw data were used across instances 0, 2, 3. Total volume of white matter hyperintensities were generated from T1 and T2 FLAIR brain images. Hippocampal left/right volumes were generated from subcortical (FIRST) T1 structural brain images. All minimally adjusted linear mixed effects models were adjusted for cognitive outcome ~ imaging variable + baseline age + baseline age² normalized + time + female sex + (1|participant). Quadratic terms normalized by variable² / 1000. All fully adjusted linear mixed effects models adjusted for cognitive outcome ~ imaging variable(s) + cumulative stroke admissions + cumulative other medical admissions + baseline age + baseline age² normalized + time + female sex + deprivation + education + body mass index (BMI) + normalized BMI² + smoking + depression + alcohol consumption + physical activity + hypertension + diabetes + solid tumour + (1|participant). Quadratic terms normalized by variable² / 1000. Interaction terms were not justified/not used in imaging models.

Table 12: Fully adjusted models cognitive outcomes ~ average volume of hippocampus·

Residual df	47,658			49,189		

¹CI = Confidence Interval. All p<0.0001 unless indicated.

Imaging outcomes are in units of cubic millimetres. Total volume of white matter hyperintensities were generated from T1 and T2 FLAIR brain images. Hippocampal left/right volumes were generated from subcortical (FIRST) T1 structural brain images. All available data were used across instances 0, 2, 3. All minimally adjusted linear mixed effects models were: brain imaging outcome ~ surgeries variable(s) + age + normalized age² + female sex (1|participant). All fully adjusted linear mixed effects models were brain imaging outcome ~ surgeries variable(s) + cumulative stroke admissions + cumulative other medical admissions + baseline age + baseline age² normalized + time + female sex + (1|participant). Quadratic terms normalized by variable² / 1000. All fully adjusted linear mixed effects models adjusted for cognitive outcome ~ imaging variable(s) + cumulative stroke admissions + cumulative other medical admissions + baseline age + baseline age² normalized + time + female sex + deprivation + education + body mass index (BMI) + normalized BMI² + smoking + depression + alcohol consumption + physical activity + hypertension + diabetes + solid tumour + (1|participant). Quadratic terms normalized by variable² / 1000. Interaction terms were not significant/used in imaging models.

Table 18. Fully adjusted models. primary brain imaging outcomes ~ high complexity cumulative surgeries

Baseline age	1·093	1·085, 1·102		1·111	1·094, 1·127	
Sex Female	1·156	1·114, 1·201		1·187	1·103, 1·278	
No. Obs.	63,467			63,467		
Log-likelihood	-34,041			-12,131		
AIC	68,094			24,274		
BIC	68,148			24,328		
Residual df	63,461			63,461		

¹OR = Odds Ratio, CI = Confidence Interval. All p<0·0001 unless indicated.

Table 28. Foundation models. Reaction time 1SD/2SD cognitive decline ~ surgical admissions (binary) I·2 – I·0 & I·3-I·2

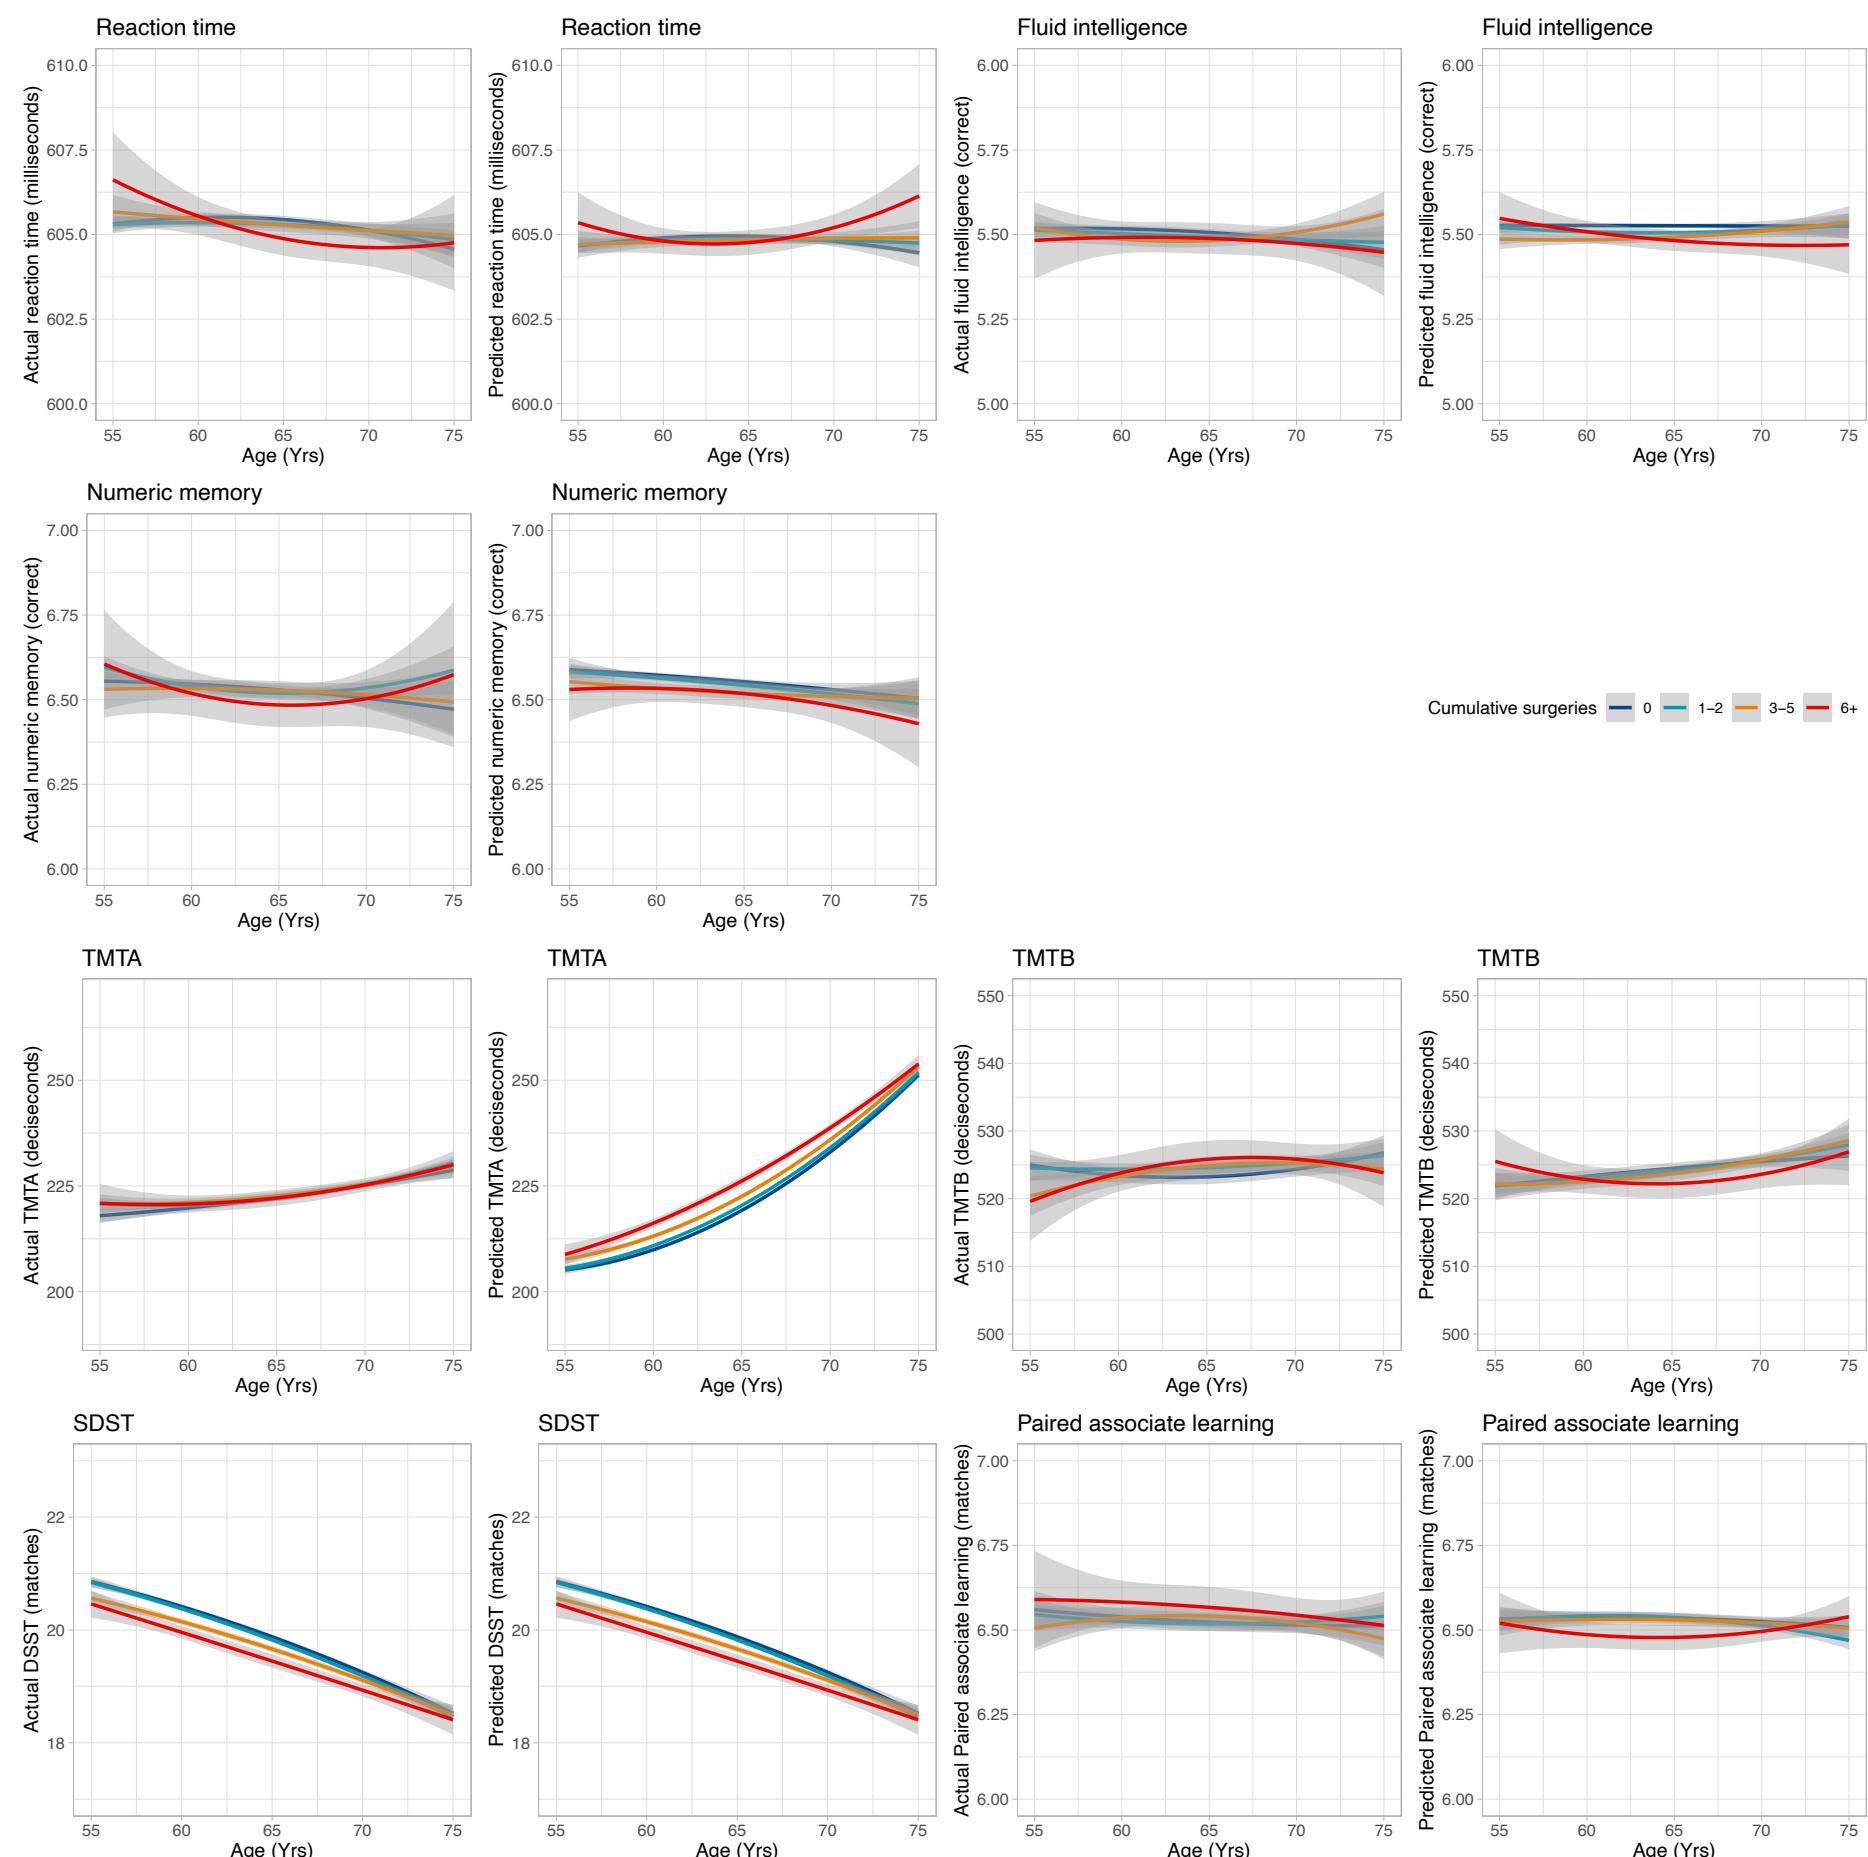

Primary outcome. reaction time	Cognitive Decline 1SD			Cognitive Decline 2SD			
	Characteristic	OR ¹	95% CI ¹	p-value	OR ¹	95% CI ¹	p-value
Surgical admissions	1·051	1·009, 1·095		0·0178	1·063	0·979, 1·154	0·1465
Time in years	1·032	1·030, 1·035			1·047	1·042, 1·052	
Baseline age	1·094	1·086, 1·103			1·112	1·096, 1·128	
Sex Female	1·161	1·119, 1·206			1·192	1·108, 1·283	
No. Obs.	63,467				63,467		
Log-likelihood	-34,046				-12,133		
AIC	68,105				24,278		
BIC	68,159				24,332		
Residual df	63,461				63,461		

¹OR = Odds Ratio, CI = Confidence Interval. All p<0·0001 unless indicated.

Table 29. Foundation models. Reaction time 1SD/2SD cognitive decline ~ high complexity surgical admissions (binary) I·2 – I·0 & I·3-I·2

Primary outcome. reaction time	Cognitive Decline 1SD			Cognitive Decline 2SD			
	Characteristic	OR ¹	95% CI ¹	p-value	OR ¹	95% CI ¹	p-value
Major surgical admissions	1·061	1·019, 1·106		0·0042	1·029	0·951, 1·114	0·4652
Time in years	1·032	1·029, 1·035			1·047	1·042, 1·052	
Baseline age	1·094	1·086, 1·102			1·112	1·096, 1·129	
Sex Female	1·158	1·116, 1·202			1·191	1·107, 1·282	
No. Obs.	63,467				63,467		
Log-likelihood	-34,045				-12,134		
AIC	68,102				24,279		
BIC	68,157				24,334		
Residual df	63,461				63,461		

¹OR = Odds Ratio, CI = Confidence Interval. All p<0·0001 unless indicated.

Figure 2. Plots of actual and predicted values for fully adjusted models: association of cumulative surgeries at a specific age for all cognitive outcomes.

TMTA = Trail making test A; TMTB = Trail making test B; SDST = Symbol digit substitution test. Reaction time, fluid intelligence and numeric memory include Instance-0, Instance-2, and Instance-3 data. TMTA, TMTB, SDST and paired associate learning include Instance-2 and Instance-3 data. All linear mixed effects models fully adjusted for cognitive outcome ~ cumulative surgeries + cumulative stroke admissions + cumulative other medical admissions + baseline age + baseline age² normalised + time*deprivation + female sex + education + body mass index + body mass index² normalised + smoking + depression + alcohol consumption + physical activity + hypertension + diabetes + solid tumour + (1|participant). Quadratic terms normalised by variable² / 1000. Interaction for surgeries*other medical admissions included in reaction time and fluid intelligence fully adjusted models. Linear smoothing uses the formula, $y \sim x + I(x^2)$.
