SUPPLEMENT S1: CASE DEFINITIONS

ACUTE RESPIRATORY INFECTION (ARI)

Acute respiratory infection (ARI) European Union case definition, 2018 [1].

- *Sudden onset of symptoms*

AND

- *At least one of the following four respiratory symptoms*
 - (1) *Cough*
 - (2) *Sore throat*
 - (3) *Shortness of breath*
 - (4) *Coryza*

AND

- *A clinician's judgement that the illness is due to an infection*

INFLUENZA-LIKE ILLNESS (ILI)

We used the Royal College of General Practitioners Research and Surveillance (RCGP-RSC) ILI case definition [2].

"An acute respiratory illness with a temperature measured as, reported as, or plausibly ≥38 °C and cough, with onset within the past 10 days. ILI cases should not have another more plausible diagnosis. ILI cases have a sudden onset, and there are often symptoms suggestive of systemic upset—myalgia, fatigue, malaise, headache, etc. RCGP RSC stresses the notion of symptoms within 10 days of onset to differentiate acute episodes, with swabs only wanted within 7 days of onset."

UPPER RESPIRATORY TRACT INFECTION (URTI)

We created case definitions for URTI based consensus within our team of public health, clinical and informatics experts.

An acute infection of the respiratory tract above and including the larynx, encompassing the nasal mucosa, paranasal sinuses, middle ear, pharynx and larynx.

LOWER RESPIRATORY TRACT INFECTION (LRTI)

We created case definitions for LRTI based consensus within our team of public health, clinical and informatics experts.

An acute infection of the respiratory tract below the larynx, including bronchus, bronchioles and alveoli.

EXACERBATIONS OF CHRONIC LUNG DISEASE (ECLD)

We created case definitions for ECLD based consensus within our team of public health, clinical and informatics experts.

A sudden deterioration in respiratory symptoms such as cough, sputum production or breathlessness in an individual with underlying lung disease including chronic obstructive pulmonary disease, asthma and other chronic lung diseases.

SUPPLEMENT S2: ARI CLINICAL QUALITY LOGIC (CQL)

The clinical quality language (CQL) script for the acute respiratory infection (ARI) phenotype definition.

SUPPLEMENT S3: PHYSICIAN FLOW CHART FOR RECORDING ARI

Flow chart provided to RSC member primary care practices to support accurate coding of ARI cases by clinicians. We generally try to discourage coding of ARI-NOS as this allows us to be more specifically assign cases to a level 2 indicator. ARI-NOS is therefore not included in this flow chart.

SUPPLEMENT S4: EXPRESSION CONSTRAINT LANGUAGE (ECL)

Example of SNOMED Expression Constraint Language (ECL) for pharyngitis.

Most codelists were defined using the following three steps: **Step 1:** Inclusion of a principal SNOMED supertype(s) and all its descendant codes. For example, we include sinusitis and all its descendant codes, such as frontal sinusitis **Step 2:** We usually did not want to include all descendant codes in the final codelist so rather than pick out individual codes to remove we excluded codes at a higher level in the hierarchy. For example, we excluded a code for chronic disease, which are not relevant to ARI. This has the effect of removing all sinusitis descendant codes that represent instances of chronic sinusitis. **Step 3:** Finally, each codelist needed inclusion or exclusion of specific codes only, allowing for tailored changes to meet the needs of the specific codelist.

SUPPLEMENT S6: DATA SECURITY PROCEDURES AT THE RSC

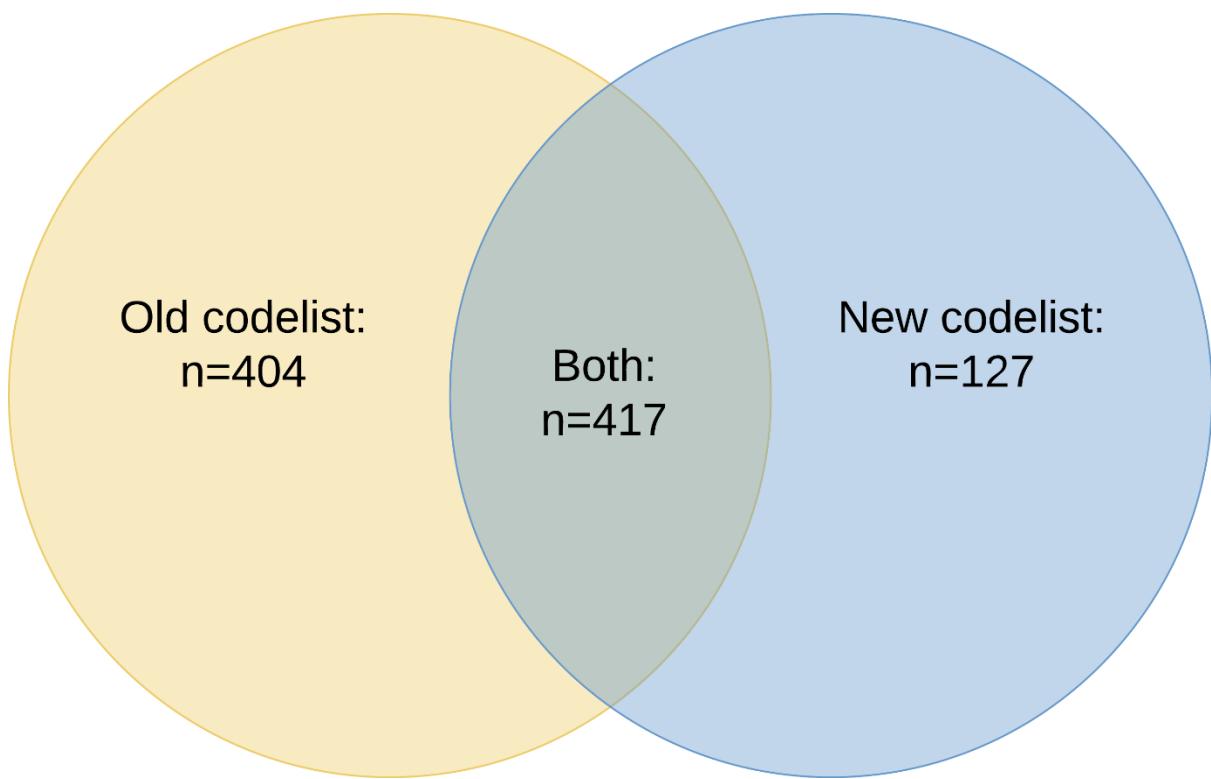

Infrastructure: ORCHID secure servers are held physically in a locked and monitored data centre in Oxford with highly restricted access. Access, management and analysis of patient level pseudonymised data is only possible within restricted folders of the secure ORCHID server via a virtual private network (VPN) and requires multifactor authentication (MFA). Transfer of data outside of the secure server follows a strict approval process. Only aggregate and summary data can be transferred outside the secure server. Individuals accessing the data need to undertake appropriate annual data security training.

Statistical disclosure controls (SDCs): These are methods designed to protect the confidentiality of individuals' data in this study while still allowing for the publication of useful and accurate statistics.

1. **Anonymisation:** Although the data is not totally anonymised, all directly identifiable personal data is removed; no names or contact details are included.
2. **Pseudonymisation:** The NHS number is pseudonymised using a hashing algorithm (prior to receipt of the data). This converts the NHS number to a fixed number of digits totally distinct from the original NHS number. Although hashing is a one-way process if an individual has knowledge of an NHS number and its equivalent hashed version they could, in theory, identify the algorithm. To counter this, what's known as a salt is used. This is where a random sequence is added to the NHS numbers before hashing occurs. Without access to the salt it would be essentially impossible to determine the NHS numbers from their hashed equivalent. Data can only be formally linked back to other data sets with NHS numbers if exactly the same algorithm is applied to the data with the same salt.
3. **Perturbation:** Dates of birth have been rounded to the nearest month.
4. **Aggregation:** Data transferred out of the secure server will be summary statistics only. Thus will no longer be regarded as personal data.

Data minimisation: Only data required for the purpose of the study will be held within ORCHID folder within the secure server. As a consequence of these measures, identification of individuals directly or indirectly using linked data is highly unlikely, even by research members, as the data used in this specific project will be limited to that which is essential to fulfil the objectives. Identifying the individuals by triangulation of these limited data points would be exceptionally unlikely.

SUPPLEMENT S7: VENN DIAGRAM OF CODLEIST

The old codelists included $404+417=821$ codes and the new codelist included $127+417=544$ codes. 417 codes appeared in both codelists, 404 only in the old and 127 only in the new codelists.

SUPPLEMENT S8: ARI INCIDENCE BY AGE AND RISK GROUP

Indicator	Risk group	Age band	Total case during study			Weekly rate / 100k	
			New	Old	% Change	New	Old
ARI	Non-risk	0-17	813,364	710,060	14.55	436.50	375.95
		18-69	726,490	565,643	28.44	148.80	115.15
		70+	51,965	41,039	26.62	128.05	101.00
	Risk	0-17	91,521	71,978	27.15	480.45	387.90
		18-69	513,302	363,681	41.14	336.50	234.85
		70+	281,831	212,940	32.35	339.55	254.15
	Non-risk	0-17	6,879	6,879	0.00	1.95	1.95
		18-69	22,233	22,234	0.00	3.00	3.00
		70+	1,039	1,039	0.00	1.50	1.50
	Risk	0-17	1,006	1,006	0.00	2.60	2.60
		18-69	10,766	10,767	-0.01	4.55	4.55
		70+	4,603	4,604	-0.02	2.80	2.80
ILI	Non-risk	0-17	116,620	108,154	7.83	56.55	54.70
		18-69	223,505	150,058	48.95	44.80	30.05
		70+	31,293	22,894	36.69	76.35	54.25
	Risk	0-17	17,512	14,333	22.18	89.30	74.30
		18-69	244,124	179,728	35.83	159.35	116.40
		70+	194,010	163,895	18.37	232.80	197.65
	Non-risk	0-17	707,263	634,517	11.46	381.45	337.70
		18-69	490,165	408,016	20.13	98.80	82.30
		70+	19,746	18,322	7.77	50.25	46.60
	Risk	0-17	70,250	60,735	15.67	369.70	327.10
		18-69	215,760	185,560	16.28	137.10	118.10
		70+	53,697	50,782	5.74	63.40	57.30

S7: Median weekly rate for level-1 and level-2 Acute Respiratory infection (ARI) indicators by age band and risk group compared to the previous indicators. The rate is based on denominator of 17,433,074 subjects. % change = percent change in total cases over the study period. ILI: influenza-like illness, ECLD: exacerbations of chronic lung disease. LRTI: lower respiratory tract infection, URTI: upper respiratory tract infection. Note that ECLD is a new indicator and does not have a suitable comparator. The totals numerators of level-2 indicators do not add up to the ARI numerator as we have not included cases from the level-2 ARI-NOS category.
