Supplementary Figure S1 The flower of the line #3 transformed plant (Figure 2D) consisted of (from left to right) four tepals, one pistil, and three stamens.

Supplementary Figure S2 Root colors of transformed plants (lines #1–#6) and non-transformed plants (Wild) *in vitro*. Photographs were taken from the bottom of the culture vessels.

Supplementary Figure S3 The transformed plants of lines #3 and #4, which were taken out of the pots (Figure 3). The line #3 plant consisted of an elongating shoot with 4 scaly leaves, and the line #4 plant consisted of an elongating shoot with 7 scaly leaves. The upper half of scaly leaves were deeply anthocyanin-pigmented in the line #4 plant.

Supplementary Figure S4 Abaxial side of scaly leaves of the transformed plants from lines #5, #3, and #2, and of two non-transformed plants (Wild).

Supplementary Figure S5 Appearances of a callus-derived non-transformed *L. formosanum* plant. Note that this bulb was subject to chilling to stimulate shoot elongation and flowering.
