

SUPPLEMENTARY FIGURE 1: Output of Cox Proportional Hazards Model for Multivariate PFS1 Analysis in HDM-ASCT Recipients with MM (Combined Cohort). Adjusted Hazard Ratios (HR) are shown with corresponding 95% confidence intervals. Statistically significant values are shown in red, while non-significant values are shown in cyan. After adjusting for age, ISS stage, high-risk cytogenetics, induction regimen and lenalidomide maintenance, being a PGV-A carrier remained significantly associated with longer PFS1 in MM patients who underwent HDM-ASCT in the Combined cohort. NS = non-significant.
