Table S1 - Summary of the results reported by studies included in the scoping review

<u>Abbreviations</u>: NSC: Non ordinary State of Consciousness, EEG: Electroencephalogram, fMRI: functional Magnetic Resonance Imaging, SPECT: Single Photon Emission Computed Tomography, TMS-EEG: Transcranial Magnetic Stimulation and Electroencephalography, ECG: Electrocardiogram, EMG: Electromyogram, GSR: Galvanic Skin Response, rCBF: regional cerebral blood flow, ACC: Anterior Cingulate Cortex, PCC: Posterior Cingulate Cortex, PTSD: Post Traumatic Stress Disorder, AICT : Auto-induced cognitive trance, TMDs: Temporomandibular joint disorders, yo: Years old, VAS; Visual Analogical Scale, Vo2max: maximum volume of oxygen, L: Left, R: Right.

*Limitation reported by the authors of the scoping review (not in the original paper)

Note: The age, sex, induction and practice of NSC are not indicated when they are not reported in the article

Author, years	Category	Aim of the study	Type of NSC and induction	Sample information Recruitment and qualification	Method	Measures	Results	Limitations (*)
Houran et al., 1997	Phenomenology Psychology	Explain specific perceptual con- tents during sha- manic experi- ences	Shamanic Journey <u>Induction</u> : Harner method (drumming)	N=30 1 st -hand experiences of shamanic jour- neys	Experiences se- lected by Harner as examples of 1 st -hand experiences of sha- manic journeys	Narratives reports	Phenomenology: Presence of visual (e.g., a moving shadow, amorphous light) or auditory (footsteps, percipient's name being called out, animal vocalizations) experiencesPsychology: Supernatural beliefs in 33% participants	Selective narrative report by the authors* Lack of information on the analysis*
Maurer et al., 1997	Psychology	Examine effects of drumming on NSC and rela- tionships be- tween these ef- fects and hypno- tizability	Shamanic journey <u>Induction</u> : Trance state: 16-inch Mylar drum session (live record- ing) Hypnotic state: stand- ard hypnotic induction pro- cedure of the Harvard Scale, Form A	N=169 Psychology students <u>Recruitment</u> : volun- tary participation (choice between several projects)	6 groups: random- ized 2 conditions: 1- drum followed by hypnotic induction 2- hypnotic induc- tion followed by drum	Written free narratives Psychological ques- tionnaires: Phenome- nology of Conscious- ness Inventory and Harvard Group Scale of Hypnotic Suscepti- bility, Form A	Psychology: When the drum came before hypnosis: ↑ hypnotizability and ↑ intensity scores for body image, absorption and attention Participants with higher hypnotizability scores reported relaxed feelings and shamanic-like experiences	No assessment of participants' prior beliefs* No verification that the drum- ming induces trances*
Krycka, 2000	Phenomenology Clinical	Explore mean- ings of illness and healing po- tential of sha- manic tech- niques (sha- manic journey,	Shamanic journey <u>Induction:</u> Drumming (tape or real drum) and shamanic	N=15 Patients with a ter- minal or life-threat- ening illness who experienced a sha- manic journey at some time before the study	Random assignment of one of the 2 sha- manic practitioners which use 3 tech- niques (shamanic journey, power ani- mal retrieval, and soul retrieval)	Phenomenological In- terviews (before and within 1 month after intervention)	Phenomenology:Feeling dizzy, buzzing head, better understanding of one's life or illness, changes in somatosensory processes, visual and auditory hallucinations, communication with en- tities during shamanic journeyClinical:Personal agency: able to "do some- thing" about being ill; Omniscient guide: able to anticipate events that they could not see before	Recruitment: known by thera- pist, patients have some famil- iarity with shamanic methods Small sample*

		power animal re- trieval, and soul	practitioner's guidance.	<u>Age</u> : 21-56 yo			the intervention; Embodiment: their lost parts re- stored back into conscious awareness; Self-di-	
		retrieval)		Sex: 5 men, 10 women			rected experience; Acceptance; free welcoming of the experience, modified perception of illness; Resilience: able to adapt to new and changing circumstances brought on by illness	
				HIV/AIDS, multiple sclerosis, cancer, Epstein Barr virus infection diagnosed within 2 years				
Kawai et al., 2001	Phenomenology Physiology	Investigate physiological mechanism un- derlying posses- sion trances by examining plasma concen- trations of neu- roactive sub- stances	Possession trance	N=24 Healthy participants as they were per- forming a ritual ded- icatory drama <u>Age</u> : 35 ± 8 yo <u>Sex</u> : men <u>Recruitment</u> : cf method	2 groups formed a posteriori: based on appearance and be- havior of subjects in the drama, subjects divided in Trance group, N=15 and Control group, N=9 2 conditions: 1- before trance 2- after trance	Phenomenological questions (episodic re- call and subjective trance impressions) Clinical interview (medical, trance and family history Physiological measures: plasma con- centrations (3 cate- cholamines; 3 cate- cholamines; 3 cate- cholamine metabolites and 3 neuropeptides, blood pressure, heart rate)	Phenomenology: Trance group: Fixed, unfocused eyes, mask-like expression, stiffening of limbs, tremors, repeated automatism-like behaviors, falling to the ground, reported sense of well-being and euphoria, anterograde amnesia, eat chicks Control group: None of them ate the live chicks, but otherwise they performed the same actions as those of the trance group Physiology: ↑ heart rate for 2 groups, no difference in blood pressure, ↑ noradrenaline, dopamine and beta-endorphin after ritual for trance group	No examination of indexes representing strength of physi- cal exercise (e.g., Vo2max, blood lactic acid concentra- tion) Constitution of 2 groups a pos- teriori*
Oohashi et al., 2002	Phenomenology Psychology Neurophysiol- ogy (EEG)	Verify useful- ness of portable EEG to study trance in natural environment Report 1 st EEG findings on pos- session trances	Possession trance <u>Induction</u> : Vigorously beating bam- boo musical instrument with stick	N=3 Healthy participants as they were per- forming a ritual ded- icatory drama <u>Age</u> : 30 yo <u>Sex</u> : men <u>Recruitment</u> : cf method	2 groups formed a posteriori: based on appearance and be- havior of subjects in the drama, subjects divided in Trance group, N=1 and Control group, N=2 3 conditions: 1- resting state 2- trance 3- post-trance	Phenomenological questions (episodic re- call and subjective trance impressions) + Behaviors recorded on videotape Interviewed regarding personal facts and past history Standard clinical in- terview EEG	Phenomenology: Average trance duration of 7min50 with automatic movements, falls and loss of consciousness, stiffening and tremors, anterograde amnesia Psychology: No psychiatric pathologies Neurophysiology: In trance, ↑ power frequency theta, alpha1 and alpha2 (especially occipital); No epilepsy	Case study Potential contamination of EEG with movements No measure of carbon dioxide concentration on exhalation to show that no hyperventilation would affect EEG data Potential activation of linked earlobe reference electrodes Constitution of 2 groups a pos- teriori*

Park et al., 2002	Phenomenology Neurophysiol- ogy (EEG)	Examined phys- iological basis of trance state	Korean sham- anistic danc- ing <u>Induction</u> : shamanic mu- sic and flow- ing white	N=1 Salpuri dance expert <u>Age</u> : 35 yo <u>Sex</u> : woman NSC practice: > 20	4 conditions: 1 - resting state 2 - recall/remember trance experience 3 - listening to partic- ipant's favorite mu- sic 4 - memorization of	Free recall EEG	<u>Phenomenology</u> : Ecstatic state <u>Neurophysiology</u> : Recall state: ↑ theta and al- phal in frontal and occipital areas; ↓ generalized frequency (Phi) in recall contrary to the others conditions	Case study Lack of information on neuro- physiological analyses*
0	Davahalaay	Enidemiala av	scarf, slow movements, quick turns	years	10 words	Dhanamanalagiaal	Developery Dring a sharmon not related to re-	Identification of showing
ommeren et al., 2004	Psychology	Epidemiology study of mental disorders among shamans	shamanic trance	N=5/4 Trance and non- trance practitioners <u>Sex</u> : Men <u>Age</u> (shaman): 51 yo <u>Age</u> (control group): 44 yo <u>Recruitment</u> : Inter- view	<u>1 condition</u> : struc- tured interview <u>2 groups</u> : 1- shaman (N=42) 2- non-shaman (N=532)	Phenomenological questions; (trance practice) Composite Interna- tional Diagnostic In- terview-2.1 (disorder modules: phobias and affective, generalized anxiety, persistent so- matoform pain, post- traumatic stress, and dissociative disorder) Medical investigation	<u>Psychology</u> : Being a shaman not related to re- ported lifetime and 12-month disorders; Sham- ans and non-shamans did not differ in frequency of reported disorders over 12 months and over the lifetime	Identification of shamans based on self-report Participants with psychosis excluded Overrepresentation of trauma survivors Conceptualization of mental disorders in terms of ICD-10 psychiatric constructs but dif- ferent from local conceptions of illness
Vuckovic et al. 2007	Clinical	Test feasibility and safety of shamanic heal- ing for TMDs	Shamanic journey	N=20 Patients diagnosed with TMD with no previous shamanic treatment <u>Age</u> : 25-55 yo <u>Sex</u> : women	Participants ran- domly assigned sha- manic practitioner <u>Evaluations</u> : - pre-treatment in- terview - 5 with one of the 4 shamanic practition- ers - post-treatment self-reported pain and disability, and interview	Phenomenological In- terviews Clinical question- naires: Axis II pain & disability scales and Research Diagnostic Criteria for TMDs exam	This study demonstrated the feasibility and ac- ceptability of clinical trials of shamanic healing Improvement in usual pain, in worst pain and in functional impact of TMDs	Only women Small sample* No control Group*
Lee et al., 2010	Clinical	Understand the healing symbols used by shaman	Traditional shamanic healing <u>Induction</u> : By a ritual	N=21 Patients (13 were regular attendees and 8 were newcom- ers who had visited the shrine 1 to 3 times for less than a year)	4 conditions: 1- prehealing inter- view 2- healing process with video recording 3- post-healing in- terview	McGill Illness Narra- tive Interview	<u>Clinical</u> : 11 patients perceived their consulta- tions as helpful, 4 as helpful but unable to follow all recommendations, 5 not sure of outcome be- cause they had yet to see concrete results, 1 pa- tient considered consultation unhelpful	Patient follow-up for only 1 month Recruitment bias (there were more regular patients than newcomers) No statistical analysis*

Polito et al., 2010	Phenomenology Psychology	Confirm that participation in a Native Ameri- can sweat lodge ceremony in- duces NSC Explore rela- tionships be- tween paranor- mal beliefs, alexithymia and self-reported NSC	Shamanic trance <u>Induction</u> : Sweat lodge ceremony	<u>Age</u> : 26-67 yo <u>Sex</u> : 13 women, 8 men N=55 Non-trance practi- tioners <u>Age</u> : 32±7 yo <u>Sex</u> : 29 men, 26 women <u>NSC practice</u> : 1 st time experience for 80% (44) partici- pants Recruitment: volun-	 4- follow-up interview, 1 month later by phone 2 conditions: 1- baseline 2- trance 	Altered State of Con- sciousness Scale Psychological ques- tionnaires: Paranormal beliefs scale, Toronto Alexithymia Scale and Profile of mood states questionnaire	Phenomenology: ego dissolution Psychology: ↑ positive mood after ceremony; 3 of prototypical/universal paranormal beliefs (psi, spiritualism and precognition) associated with higher ego dissolution scores; Positive rela- tionship between alexithymia and intensity of NSC; Dimension "difficulty identifying feel- ings" was the only significant predictor of "oce- anic vastness" and "visionary restructuring"	Participants did not have the same prior experiences of NSC* No investigation of psychiat- ric or neurological history*
Vuckovic et al. 2010	Phenomenology Clinical	Evaluate partici- pants' percep- tions of illness, healing process, from shamanic treatment	Shamanic journey	tary participation N=20 Patients diagnosed with TMD with no previous shamanic treatment Age: 25-55 yo Sex: women	Participants ran- domly assigned sha- manic practitioner <u>Conditions:</u> - pre-treatment in- terview - 5 with one of the 4 shamanic practition- ers - post-treatment self-reported pain and disability, and interview	Phenomenological In- terviews Clinical question- naires: Axis II pain & disability scales and Research Diagnostic Criteria for TMDs exam	Phenomenology: Relationship to TMD: ↑ optimism, hopefulness, empowerment, control over their condition, understanding of the illness; ↓ consumed thoughts & actions on a daily basis Connecting to the spiritual/transcendent self: ↑ awareness of spiritual and mystical forces, connection to animals and nature, feeling intense connection to land Connecting to a more authentic self: ↑sense of themselves, trust their instincts, confidence, balanced (back to normal) Awareness of mind-body connections: ↑connections between thoughts and emotions, and jaw clenching and pain. ↑ connection between stress and body manifestation Connecting to social self: ↑ confidence about expressing opinions or communicating with others Mechanisms of Healing: ↑ movement of energy and personal intention to change, ↑connection with shaman	Only women Small sample* No control Group*

Konopack i & Madi- son, 2018	Phenomenology Neurophysiol- ogy (EEG)	Examine possi- ble role of ex- pectation of trance state when listening to monotonous drumming	intentions and the spirit realm's guid- ance Shamanic trance <u>Induction</u> : Shamanic drum sounds	N=24 Non-trance practi- tioners <u>Age</u> : 29±8 yo <u>Sex</u> : 3 men,11 women <u>Recruitment</u> : Umeå University students and members of the Yogasällskapet yoga center	2 randomized groups: 1- without sugges- tions, neutral text, N=12 2- with suggestions that drumming can induce a trance state, N=12 2 conditions: 1- rest 2- drum sounds	The Phenomenology of Consciousness In- ventory EEG	exacerbation; substantial shift in physical body (lost 80 pounds and felt better physically) <u>Phenomenology</u> : No difference in modified ex- perience scores between groups (but relaxation reported); Altered experience score = 2.45/6 for both group <u>Neurophysiology</u> : for suggestion group, ↓ alpha during drum in occipital area	Inter-individual differences revealing heterogeneous group Recruitment bias (participants were recruited from the Yoga studio were the present author used to teach) People practicing meditation more likely to enter meditative state during experiment or control NSC in general
Wahbeh et al., 2019	Phenomenology Psychology Neurophysiol- ogy (EEG) and Physiology	Evaluate neuro- physiological correlates of channeling	Channeling trance Induction: body is used as a "vehicle" to let disem- bodied entity incorporate the medium and communi- cate directly through speech, writ- ing or move- ment	N=13 Trance practitioners <u>Age</u> : 57±13 yo <u>Sex</u> : 11 women <u>Age channeling</u> <u>practice started</u> : 39±21 years <u>Recruitment</u> : Online survey <u>Training</u> : spontane- ous - 46.2%, re- ceived training - 30.8%, self-training - 23.8%	4 counterbalanced conditions: 1- resting state 2- reading a story at rest 3- channeling 4- reading a story during channeling	Phenomenological questions (trance ex- perience) Voice recording Psychological ques- tionnaires: Patient Health Questionnaire- 4, Big Five Inventory- 10, Multidimensional Personality Question- naire, Empathy Quo- tient, Highly Sensitive Person Scale and Par- anormal Belief and Experience Scale EEG Physiological measures (ECG, GSR body temperature, res- piration)	Phenomenology: 7 participants feeling of channeling the same being for all sessions same channeling in all conditionsVoice: Story reading significantly slower during channeling; Vocal valence (negativity) significantly lower when read during channeling than at rest, no difference in temperament and arousal (power level)Psychology: No psychiatric pathologies; Positive impact of channeling on daily lifeNeurophysiology: No significant differences between trance and resting statePhysiology: no difference between rest and trance for ECG, respiration, GSR, temperature	Alternating conditions during protocol may have led to in- complete state changes Basic state of participants at rest may be relatively similar to trance state Small sample size All frequencies above 40hz filtered out Trance practitioners report dif- ferent embodied beings, so perhaps different associated brain activities Remain still and silent The "incorporated beings" are actually multidimensional as- pects of the channeler them- selves
Gosseries et al., 2020	Phenomenology Psychology Neuroimaging (TMS-EEG)	Probe trance changes of elec- trical reactivity of cortical cir-	AICT <u>Induction</u> : Vocalizations, movements	N=1 Trance practitioner <u>Age</u> : 56 yo <u>Sex</u> : women	2 conditions: 1- resting state 2- trance	Free recall and Phe- nomenological ques- tions (time perception, arousal, absorption, dissociation)	Phenomenology: ↑ awakening, ↑ absorption, ↑ dissociation, time perception modification, visu- alizations, auditory perceptions, possession, per- ception and body consciousness modification, positive emotions, ego dissolution, body move- ments	Case study No possibility of making movements during trance*

		anita ta maa				TMS EEC		
		netic perturba- tions		<u>NSC practice</u> : 17 years <u>Recruitment</u> : first AICT expert <u>Training</u> : Mongo- lian tradition		IMS-EEG	<u>Neurophysiology</u> : for frontal stimulation, \uparrow amplitude of evoked potentials; for parietal stimulation, \downarrow amplitude of evoked potentials	
Huels et al., 2021	Phenomenology Neurophysiol- ogy (EEG)	Elucidate the neural correlates of the shamanic state	Shamanic Trance <u>Induction</u> : Shamanic drum (Michael Harner's Solo Drumming)	N=37 Trance practitioners and non- practition- ers <u>NSC practice</u> : > 5 years Matched controls (age, sex + with no previous experience of trance states) <u>Training</u> : shamanic tradition or style un- der expert supervi- sion	2 groups: 1- control, N=19 2- trance practi- tioner, N=18 5 randomized condi- tions: 1- resting state 2- resting state (in a counterbal- anced order): 3- cognitive tests 4- shamanic percus- sion 5- classical music	Altered State of Con- sciousness question- naire EEG	 <u>Phenomenology</u>: for shamanic drum, shamans scores > control scores in 8 domains (complex imagery, unity, spiritual experience, bliss state, disembodiment, insight, elemental visual alterations, altered perceptions); No group differences for classical music; Shamans score sign > during drumming vs. classical music in all areas above except for visual impairments <u>Neurophysiology</u>: for drum: ↑ gamma power in shaman, positively correlated with visual impairments, ↓ diversity gamma in shamans during drumming, negatively correlated with insight, ↑ low beta criticality in shamans during drum, positively correlated with visual impairments and complex imagery For non-specific drum: ↓ alpha functional connectivity and ↑ beta functional connectivity in shamans during drumming and classical music, ↑ high beta criticality during drumming and classical music in shamans 	No electromyographic data to study movements. Gamma re- sults could be contaminated with muscle artifacts Small sample size Variability of practice and rit- uals Controls at rest while practi- tioners in trance Comparison between this study and another previous study on psychedelics (not the same method) Difficult comparison between shamanic practitioners and healthy volunteers under psy- chedelics (e.g., different meth- odologies and doses of psy- chedelics, eyes open vs. eyes closed) Lack of blinding between con- ditions or groups
Rogerson et al., 2021	Phenomenology Neuroimaging (fMRI)	Examine brain regions showing interaction with expert subject's perceptions Investigation into the percep- tion of trance	Shamanic healing trance <u>Induction</u> : Music chosen by subject	N=1 Trance practitioner <u>Age</u> : 42 yo <u>Sex</u> : woman <u>NSC practice</u> : > 20 years	2 conditions: 1- resting state 2- trance state	Phenomenological questions (trance ex- perience) fMRI	Phenomenology: Change in somatosensory sen- sations, ↑ external awareness, ↑ internal aware- ness, mental imagery, floating; Intense experi- ence correlated with highest or strongest point of trance; Rapid blinking of the eyelids, increased breathing, feeling of ecstasy <u>Neuroimaging</u> : ↑ activation in auditory cortices; R parietal area, R frontal area and prostriata area linked to high trance perception; Orbitofrontal cortex negatively activated and most correlated with music when trance was high, showing	Case study

							greatest differential between high and low trance
