Appendix Figure S1: Rotarod performance at 4 months of age following injection in neonatal demonstrates no significant phenotypic difference between wild type mice and untreated/control treated *ap4b1* ^{-/-} mice. A trend of reduced latency to fall is observed with untreated and control treated mice and a rescue with treatment. All data groups are males, n ≥ 8 per group. Data are presented as mean ± SEM and are analysed by the Kruskal-Wallis test with Dunn’s multiple comparison test.

Appendix Figure S2: Open field assessments and 9 months following treatment in neonatal mice demonstrates no significant difference between any of the treatment groups. All data groups are males, $n \geq 8$ per group. Data are presented as mean \pm SEM and are analysed by a one-way ANOVA with Tukey's multiple comparison test.

Appendix Figure S3: Male and female weight gain plotted over 35 weeks. Comparison of vectors used in the efficacy and safety studies.

Appendix Figure S4: Immunofluorescent imaging areas within distinct anatomical regions for direct comparison of ATG9A accumulation at the TGN between treatment groups

Appendix Table S1. Tabulated summary of results of a long-term mouse safety study.

This study was designed to demonstrate the long-term safety of AAV9 vectors for AP4B1 gene therapy. A number of constructs expressing AP4B1 cDNAs from non-specific and cell specific promoters were compared by both intra cisterna magna and intravenous routes. The first table summarizes the study design and mortality. The subsequent tables summarize group averages and standard errors for haematology, serum chemistry and liver histopathology.

List of Results

Study design and mortality	7
Weight gain – Female	9
Weight gain - Male	11
Haematology at Day 28	13
Haematology at 1 year	16
Serum Chemistry at Day 28	18
Serum Chemistry at 1-year	18
Liver Histology Day 28	19
Liver Histology at 1 year	21

Appendix Table S2. Tabulated summary of results of non-human primate GLP toxicology study.

This was a GLP study of the safety of AAV9/CBh-hAP4B1 by intra-cisterna magna injection of AAV vector that was a process comparable to the intended clinical product. As well as the standard general observations, weight gain, hematology, chemistry, coagulation and histopathological examinations, there was assessment of nerve conductance velocity as an index of potential functional impairment resulting from the known/previously reported DRG inflammation caused by AAV vectors. In addition, biodistribution and immune responses were measured. The following tables summarize group averages and standard error.

List of results

<i>Study cohorts: Agreed with FDA at Pre-IND stage</i>	24
Schedule of events	24
<i>Weight -individual animals</i>	25
<i>Serum Chemistry</i>	25
Complete blood count	28
<i>Coagulation</i>	32
<i>Nerve conductance Velocity and Amplitude</i>	33
<i>Humoral immune response</i>	33
<i>Biodistribution</i>	34
CNS Histopathology	35

Sciatic Nerve	Neuron degeneration	-	-	1	-	1	-
1. Locations included perivascular, meninges, choroid plexus							

Appendix Table S3: Estimate dose for human trials based on cerebrospinal fluid (CSF) volume.

Organism	Route	Total dose (genome copies)	CSF volume (ml) ¹	Vector genomes (vg)/ml
Neonatal mice ² Study # ZLY-02	ICM	1×10^{11}	0.002	5×10^{13}
Adult mouse dosing study Study # JPW-01	ICM	0.4×10^{11} to 2×10^{11}	0.04	1 to 5×10^{12}
Mouse long term toxicology Study # JAX-131579	ICM	7.5×10^{10}	0.04	1.9×10^{12}
GLP NHP toxicology ³ Study # ERBC - 20220013TCYP	ICM	High dose: 7.2×10^{13}	12	6×10^{12}
		Low dose: 1.4×10^{13}	12	1.2×10^{12}
Planned human trial dose ⁴	ICM	4.0×10^{14}	75	5.3×10^{12}

1. Volumes from Chen et al. 2023. PMID: 36606687
2. Neonatal mice – assume CSF volume scales with body weight. Note injection volume was 5ul to vector may have spread beyond the intended injection site
3. Primates were an average of 4.3kg - smaller than typical so we propose to reduce Chen’s 15ml estimate
4. Assuming 4–5-year-old patients. Please note that inclusion criteria will include 1–5-year-old patients
