## Supplement Figure Legends

**Figure S1. Pam2-ODN treatment protects against infections in *Cgas* and *Sting* knockout mice and *Ifi204* heterozygous mice.** Survival of wild type or *Cgas*<sup>-/-</sup> mice challenged with (A) influenza A virus or (B) *P. aeruginosa* 24 h after nebulized treatment with PBS or Pam2ODN. Survival of wild type or *Sting*<sup>gt/gt</sup> mice challenged with (C) influenza A virus or (D) *P. aeruginosa* one day after nebulized treatment with PBS or Pam2ODN. Survival of wild type or *Ifi204*<sup>+/+</sup> mice challenged with (E) influenza A virus one day after nebulized treatment with PBS or Pam2ODN. \* p <0.01 vs. PBS-treated syngeneic mice treated by log rank analysis.

**Figure S2. Identification of candidate ODN receptors.** (A) Streptavidin precipitation from lysates of HBEC3-kt cells treated as indicated were resolved by polyacrylamide gel electrophoresis and Coomassie stained. Boxes indicate bands excised for LC-MS analysis. (B) Euler diagram of LC-MS-identified proteins binding to ODN, biotinylated-ODN or both in A.

**Figure S3. Uncut blots from Figure 2.** (A) Uncut blot from Panel 4A. (B) Uncut blot from Panel 2B. (C) Uncut blots from Panel 2C, LI-COR fluorescent imaging for FITC-labeled ODN (left) and immunoblot for RIG-I (right). (D) Uncut blots from Panel 2D, LI-COR fluorescent imaging for FITC-labeled ODN (left) and immunoblot for RIG-I (right).

**Figure S4. RIG-I interaction with ODN is independent of RNA polymerase III.** (A) MLE-15 cells were pre-treated with PBS or RNA polymerase III inhibitor ML-60218 for 8 h, then 5s rRNA transcription was examined by qPCR. (B) MLE-15 cells were treated with PBS or ML-60218 for 8 h, then exposed to unlabeled ODN or 3' biotinylated-ODN for 2 h prior to streptavidin pulldown of RIG-I. (C) MLE-15 cells were exposed to unlabeled ODN or 5' or 3' biotinylated-ODN for 2 h prior to streptavidin pulldown of RIG-I. \* p<0.0001 vs PBS-treated by two-way Student's t test.

**Figure S5. Uncut blots from Figure 4.**

**Figure S6. MAVS aggregation upon RIG-I activation by RNA ligand or ODN.** HBEC3-KT cells were treated with a known RIG-I ligand 3p-hpRNA or ODN M362 for the indicated times, then examined by MAVS immunoblotting. The smears above the predicted MAVS band indicate MAVS aggregates. GAPDH was a loading control. 3p-hpRNA, 5' triphosphate hairpin RNA.

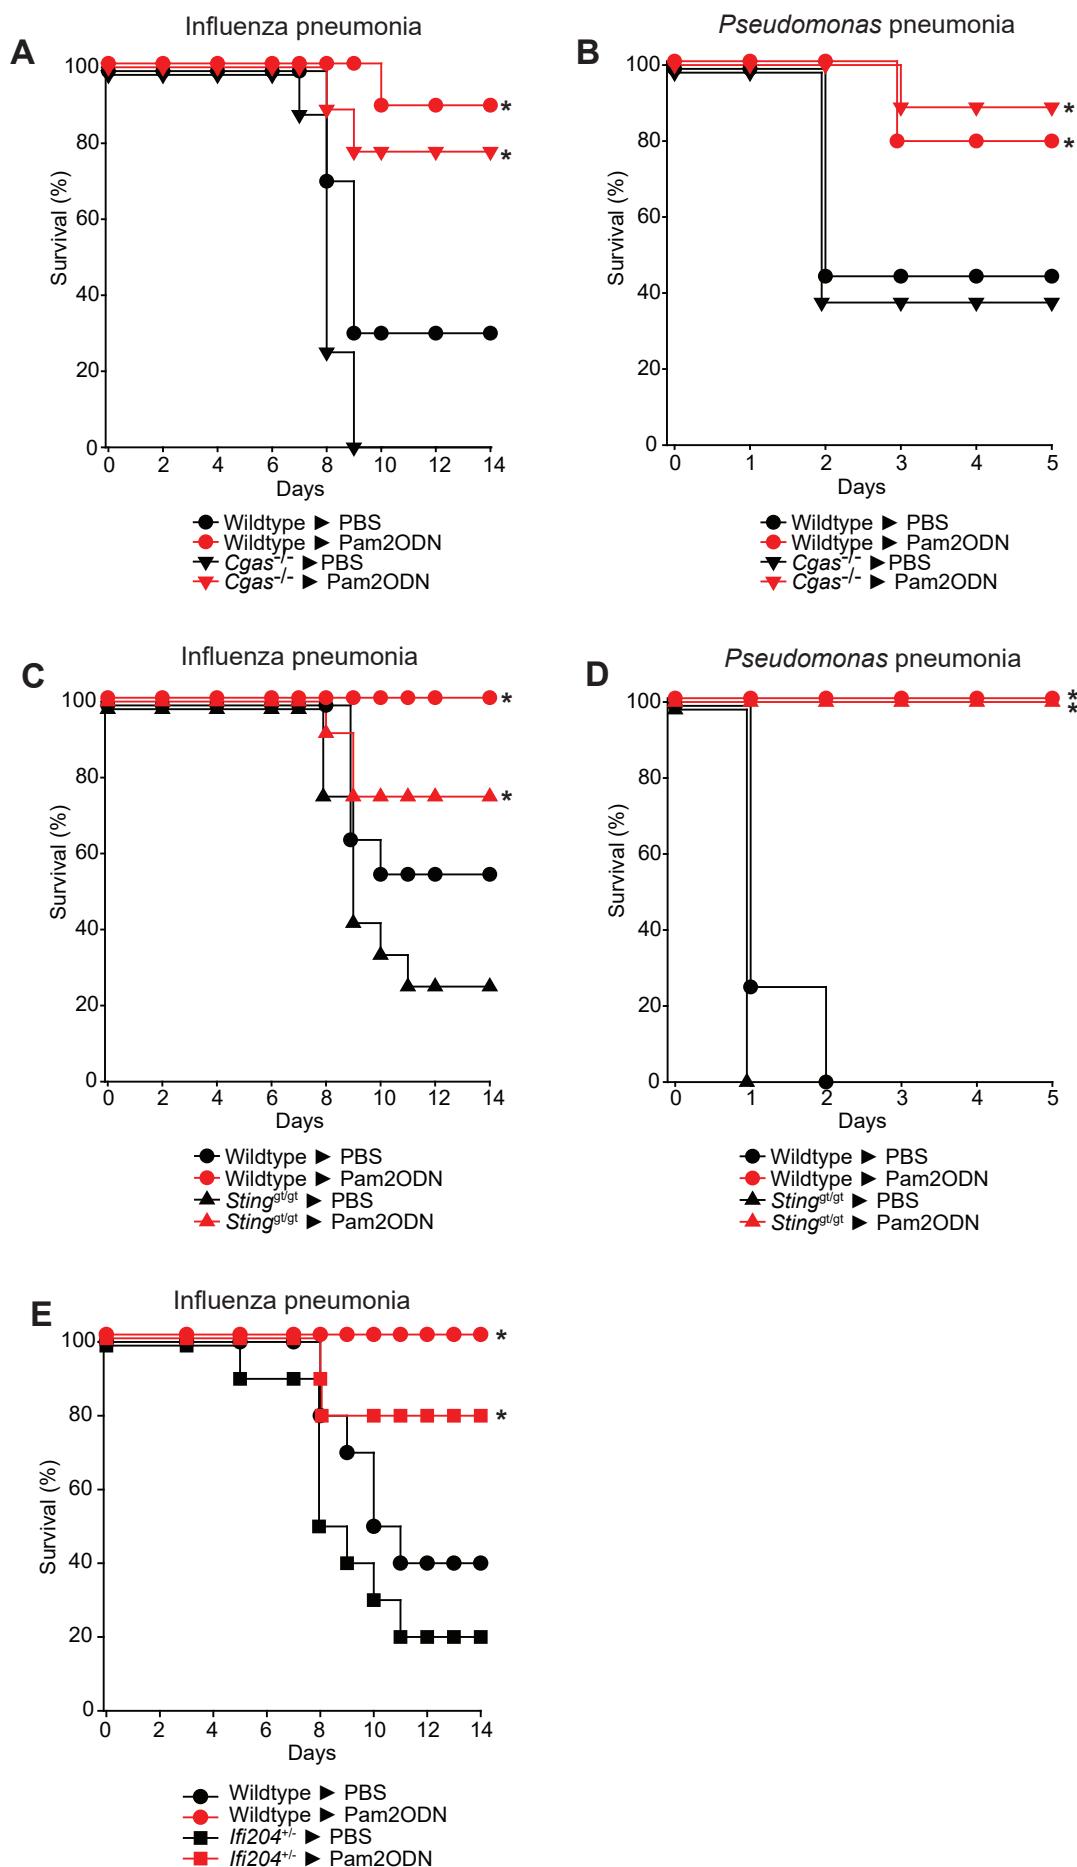

**Figure S7. Influenza A inoculum-dependent survival of wildtype, *Mavs* or *Tlr9* knockout mice.** Wildtype mice (A), *Tlr9*<sup>-/-</sup> mice (B) or *Mavs*<sup>-/-</sup> mice (C) were challenged with inhaled influenza A virus at the indicated inocula. Shown is survival after infection.

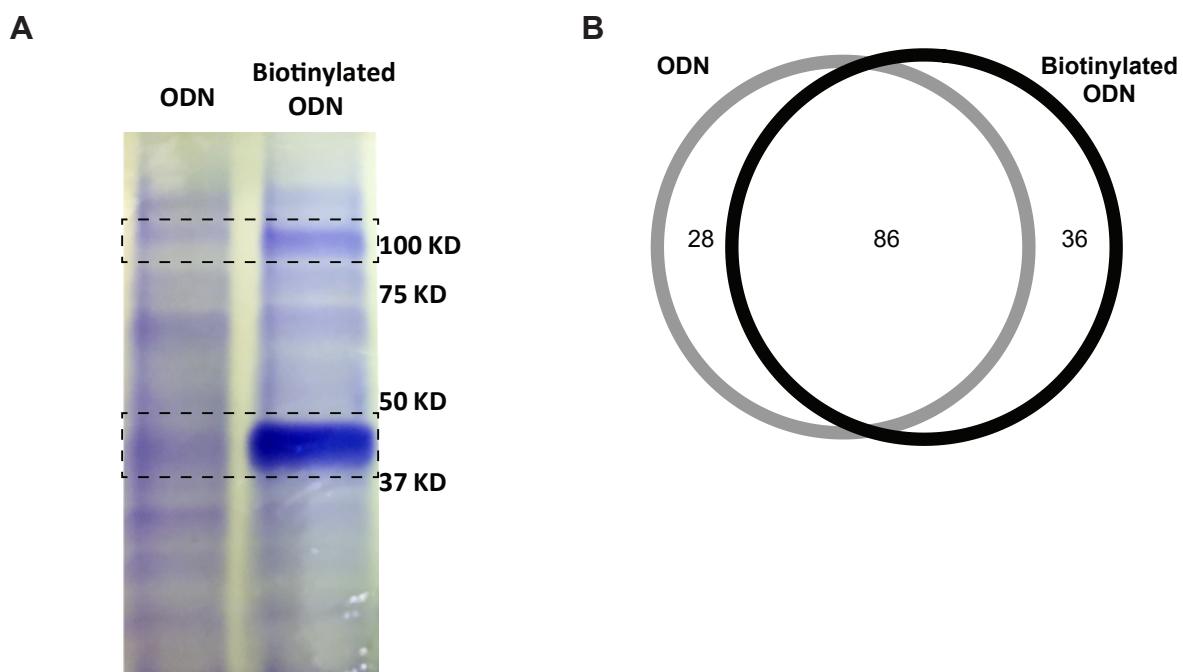

**Figure S8. Single ligand ODN treatment-induced *Cxcl10* expression and type I interferon production in mouse lungs.** *Cxcl10* gene expression in lung homogenates from wildtype or *Tlr9*<sup>-/-</sup>; *Mavs*<sup>-/-</sup> mice (A) or *MyD88*<sup>-/-</sup>; *Mavs*<sup>-/-</sup> mice (B) 4 h after nebulized PBS or ODN treatment, measured by qPCR. Interferon α1 (C) and β (D) in lung homogenates from wildtype or *Tlr9*<sup>-/-</sup>; *Mavs*<sup>-/-</sup> mice 24 h after nebulized PBS or ODN treatment, measured by ELISA.\* p<0.02 vs PBS-treated wildtype by one-way ANOVA (Holm-Sidak method).

**Figure S9. RIG-I/ MAVS is not involved in mitochondrial ROS pathway in lung epithelial cells.** (A) MitoSOX fluorescence in HBEC3-KT RIG-I knockdown cells or scrambled shRNA control cells, shown 100 minutes after treatment with PBS (sham) or Pam2ODN. (B) Efficacy of MAVS shRNA knock down in HBEC3-KT cells was determined by immunoblotting. (C) MitoSOX fluorescence in HBEC3-KT MAVS knockdown cells or scrambled shRNA control cells, shown

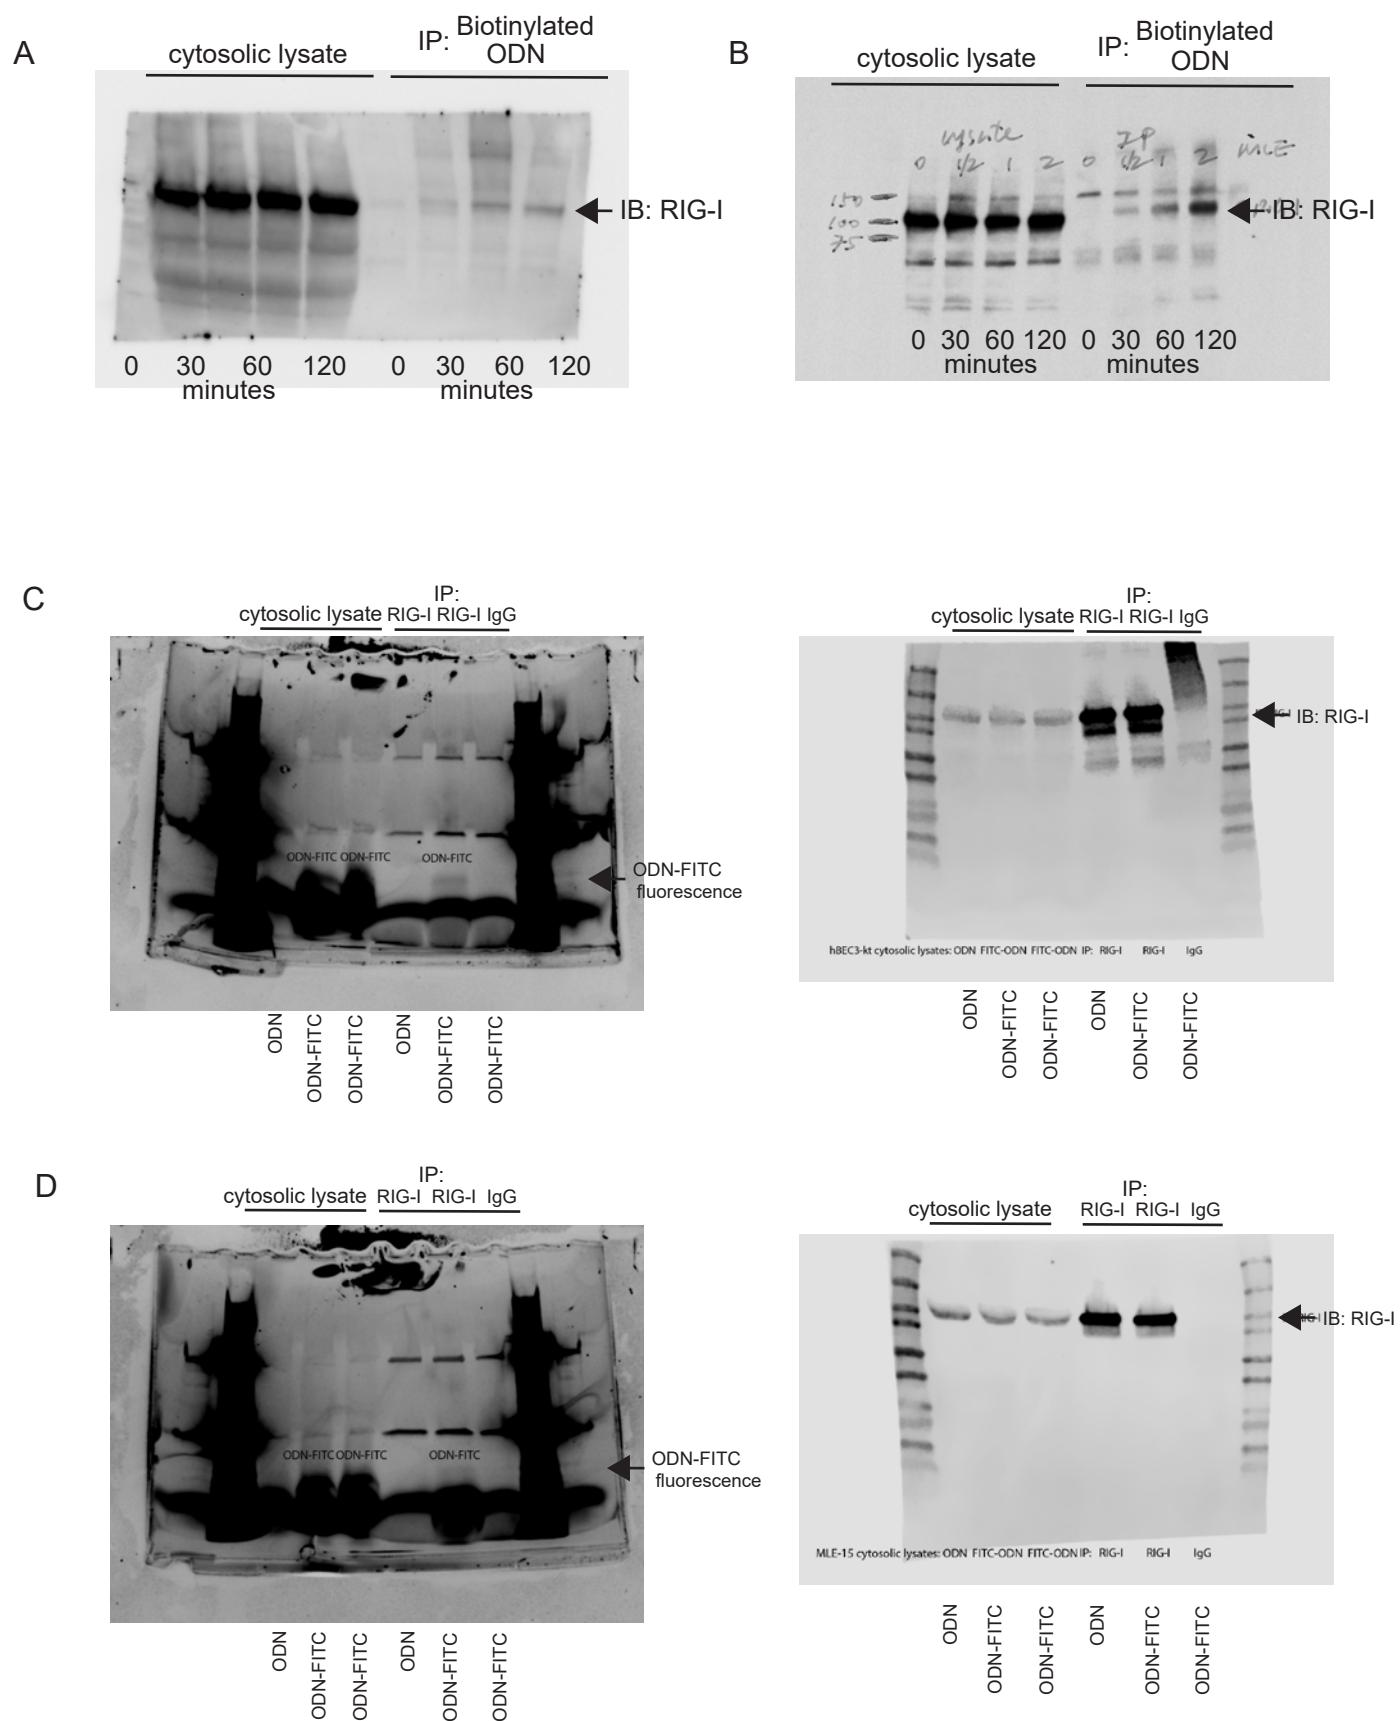

100 minutes after treatment with PBS or Pam2ODN. P values reflect intergroup analyses by one-way ANOVA (Holm-Sidak method).
