Supplementary Figure S1 Whole-body images of a healthy female at 10 minutes (**A**) and 90 minutes (**B**) after [¹⁸F]SF51 injection. The images are displayed in standardized uptake value (SUV) as a two-dimensional compression with maximal intensity projected (MIP) forward to emphasize contrast at the edge of organs. The images are decay-corrected to time of injection.

Supplemental Figure S2. Representative human arterial plasma radiochromatograms for [¹¹C]PBR28 and [¹¹C]ER176 at 90 minutes after radioligand administration. No radioactivity was detected eluting after the parent peak.
