15 ***Preparation of calibration curves and Cr(VI) stock solution***

16 For the preparation of calibration curve, Cr(VI) solutions with concentrations of 0.5, 1.0, 2.0, 3.0,
17 4.0, and 5.0 mg/L were prepared from a 1000 mg/L standard Cr(VI) solution (Sigma) and diluted
18 with 0.5M HNO₃. Subsequently, a linear standard curve was generated using an AAS ZA3300
19 instrument, resulting in a correlation coefficient ($R^2 =$ of 0.996). For the adsorption experiments,
20 the desired concentration of the Cr(VI) stock solution was prepared by diluting it from the 1000
21 mg/L standard Cr(VI) solution in deionized water and adjusting the pH using 0.1-0.5M HNO₃ and
22 0.1-0.5M NaOH.

23 ***Investigation of factors influencing the adsorption process***

24 ***Effect of pH:*** The pH of the Cr(VI) adsorption process was investigated at values of 2.0-11.0.
25 Specifically, 50 mL of a Cr(VI) solution with a concentration of 85 mg/L was introduced into 100
26 mL glass containers, each containing 0.1 g of CCBC, at the specified pH values for adsorption.
27 The adsorption process was carried out using a magnetic stirrer (RSM-03-10K, Germany) with a
28 stirring speed of 250 rpm at 34 °C and $t = 180$ mins. After adsorption, the biochar was separated
29 from the solution using centrifugation (6000 rpm for 30 minutes). The Cr(VI) concentration before
30 and after adsorption was analyzed using a AAS (ZA3300, Hitachi, Japan).

31 ***Effect of contact time:*** Adsorption time was investigated in the range of 5 to 270 mins at pH =
32 2.0, $T = 34$ °C, Cr(VI) concentration of 85 mg/L ($V = 50$ mL), $m_{\text{biochar}} = 0.1$ g. The adsorption
33 process and Cr(VI) concentration analysis were conducted in a manner similar to the previously
34 described procedure.

35 ***Effect of initial Cr(VI) concentration:*** Various Cr(VI) concentrations were investigated
36 sequentially: 25, 50, 75, 100, 125, 150, 175, 200, and 225 mg/L to calculate isotherm adsorption
37 models. The adsorption process was carried out with 50 mL of Cr(VI) solution at pH = 2.0, $t = 180$
38 mins, $m_{\text{biochar}} = 0.1$ g at 34 °C, 44 °C, and 54 °C respectively.

39 ***Effect of adsorbent dosage and ionic strength:*** The influence of adsorbent dosage and ionic
40 strength was studied under the following conditions: pH = 2.0, $t = 180$ mins, $T = 34$ °C, with a
41 volume of 50 mL and a Cr(VI) concentration of 85 mg/L. Adsorbent dosage ranged from 0.05 to
42 0.15 g (0.05; 0.075; 0.1; 0.125; 0.15), and ion strength was varied from 0.0 to 18.63×10^3 mg/L of
43 KCl (0.0; 3.72; 7.45; 11.18; 14.91; 18.63×10^3).
