**Additional file 3.** Correlation between root morphological traits and total P uptake. ns, \*, and \*\*\* indicate non-significant and significant differences at  $p < 0.05$  and  $p < 0.001$ , respectively, by Pearson correlation.

**Additional file 4.** Correlation between root sugar concentration and root morphological traits. ns, \*, and \*\*\* indicate non-significant and significant differences at  $p < 0.05$  and  $p < 0.001$ , respectively, by Pearson correlation.

**Additional file 5.** Microscopic images of roots of cultivar Milva with and without *B. subtilis* inoculation using Cellbrite Fix Membrane Stains. Arrows indicate the bacterial colonies attached to the roots. B = *B. subtilis*.

**Additional file 6.** Effect of *B. subtilis* inoculation on (A) PUpE, (B) PUE, (C-F) root traits, (G) root IAA, and (H-I) sugar content in shoots and roots. Mean  $\pm$  SE ( $n=5$ ) with different lowercase letters are significantly different at the same P level and cultivar. No indication = not significantly different.
