# The Functional Evidence Use Survey

### The Functional Evidence Use Survey

#### Understanding experimental data use in clinical genomic testing

Multiplexed Assays of Variant Effects, or MAVEs, are large experimental assays that create functional evidence for many genetic variants, see the <a href="MaveDB">MaveDB</a>. This survey aims to investigate the current use of functional (experimental) data, including MAVEs, and application of functional evidence for clinical variant classification. Results from this survey will inform the MAVE Education Project, which aims to increase the use of functional evidence in variant classification in the Australian clinical diagnostic setting.

The MAVE Education project is funded by The Medical Research Future Foundation Genomic Health Futures Mission (APP2015946) and will be carried out according to the National Statement on Ethical Conduct in Human Research (2007). The ethical aspects of this research project have been approved by the HREC of QIMR Berghofer, Project ID P3920.

## Terms used in this survey:

Functional evidence - results from experimental assays, ranging from low throughput assays of a handful of variants, to extremely high throughput including MAVEs.

Variant Curation - process used to collate and review multiple different evidence types towards assigning variant pathogenicity (also known as variant classification). Includes review of suitability and weight of individual evidence types for a given variant/gene-disease relationship.

Variant Classification - assigning variant into one of multiple tiers to designate variant relationship to disease predisposition/causation e.g. Benign, Likely Benign, Variant of uncertain significance, Likely Pathogenic, Pathogenic, and additional categories depending on application.

We are seeking views from a wide range of stakeholders, so regardless of your background or training, your responses are valuable to us. All responses are anonymous. Summarised results will be used to support genetic variant interpretation education resources, and relevant findings may be published in a non-identifiable manner in peer reviewed scientific journals or relevant educational materials. Please note that survey data must be maintained indefinitely at QIMRB to comply with applicable legislations.

# Consent

Your participation in this survey is entirely voluntary. You can choose not to participate at any point in the survey by navigating away from the page. Please be aware that by clicking submit at the end of this survey you will consent to the use of the survey summary results, as described above.

Please note that you may request further information or a copy of the study's anonymous summary results by entering your contact when requested at the completion of the survey; this information will not be linked in any way to your survey responses. If you have any concerns regarding this survey, please contact the project co-ordinator.

This survey should take around 20 minutes to complete.

Please note we only require one response per participant. If you have previously completed this survey, you can exit this survey by simply navigating away from this page.

In your professional role, which of the following activities do you perform now, or anticipate you will perform in the future?

|  | do not perform | perform now | will perform in the future |
