

Supplementary Figure 6. Cytokine and chemokine levels in BALF increased with DEP and HDM exposure. Cytokine and chemokine levels in BALF were measured by ELISA (A-D). Statistical significance was determined to be $p < 0.05$ (*), $p < 0.01$ (**), and $p < 0.001$ (***) or not significant if $p > 0.05$ (N.S.). Error bars shown represent the standard error of mean (\pm SEM). The number of animals per group was 15-25.
