

## SUPPLEMENT

### Statistical analysis:

Percentile curves and look up tables for oscillometry parameters were created using the lambda, mu, sigma (LMS) method. First, this statistical method estimates the optimal power in the Box-Cox transformation to obtain normality of the transformed data (L), the median (M), and the CoV (S). They are estimated as smooth parameter curves depending on height, due to its strongest correlation with oscillometry parameters (Pearson Correlation coefficients for age = 0.67, weight = 0.59, BMI = 0.36, height = 0.69). To determine L, M and S a vector generalised additive model (VGAM v1.1-9, R-package) was fitted to estimate oscillometry parameters based on height. The degrees of freedom of the L, M, and S curves were chosen by fitting multiple models and selecting the best using the BIC (Bayesian Information Criterion). Extreme outliers (standardised residuals >5) were identified using a linear model and excluded from the LMS-model fitting process to obtain models with a good fit. The fitting approach was controlled by a maximum of n=30 iterations and a positive convergence tolerance (epsilon) of 1\*e ^-7 with effective degrees of freedom for L (1 to 5), M (3 to 10) and S (1 to 5). The parameter curves (L, M and S) of the selected LMS-model were used to construct percentile curves (5<sup>th</sup>, 10<sup>th</sup>, 50<sup>th</sup>, 90<sup>th</sup>, and 95<sup>th</sup>) for the original data. By using the variable-specific parameters L, M and S, individuals' z-scores of each Zrs parameter can be calculated using the following formula:

$$z = \frac{\left[ \frac{y}{M(t)} \right]^{L(t)} - 1}{L(t)S(t)}$$

In our analysis, we relied on values of Rrs and Xrs as provided by the device in use. Despite the inclusion of an additional method for identifying artifacts such as glottis closure and cough, visual inspection of the data revealed the presence of data points suggesting residual artifacts not excluded by the device. To assess the susceptibility of the derived equations to measurement artifacts, we conducted a sensitivity analysis considering two main factors:

- 1) Susceptibility to Different Levels of Breathing Flows: Air flowing in small lungs, as observed in the pediatric population, may theoretically be more turbulent, potentially making Rrs and Xrs more dependent on breathing flow. To explore the effects of high minute ventilations on derived equations, we excluded data points associated with  $V_e > 18 \text{ L/min}$  from the analysis. The results, shown in Figure S3, demonstrate that such exclusion did not significantly affect the prediction equations.
- 2) Susceptibility to Residual Artifacts Not Filtered by the Devices: Despite the application of artifact detection algorithms embedded in the used device and the use of a threshold on the intrabreath CoV of Rtot, following recently published evidence (*Hantos Z, Wu JKY, Dandurand RJ, Chow CW. Quality control in respiratory oscillometry: reproducibility measures ignoring reactance? ERJ Open Res. 2023;9(3):3-6. doi:10.1183/23120541.00070-2023*), we applied a similar threshold of 1) 15% and 2) 30% to the intrabreath CoV of Xrs using the formula:  $X_{tot\_SD}/|Z_{tot\_MEAN}| \leq 15\%$ . While this approach effectively identified points at the extremities of our distributions, its impact on the predicted normality ranges is minimal across most explored height ranges.

It is crucial to note that our curve is susceptible to border effects at low heights. The limited number of data points with a height of less than 115 cm makes this part of the curve more sensitive to slight changes in the distribution of values. Therefore, careful consideration of these factors is imperative when applying these equations to children smaller than 115 cm.

Figure S1 shows distribution of participants according to age, height and total lung capacity.

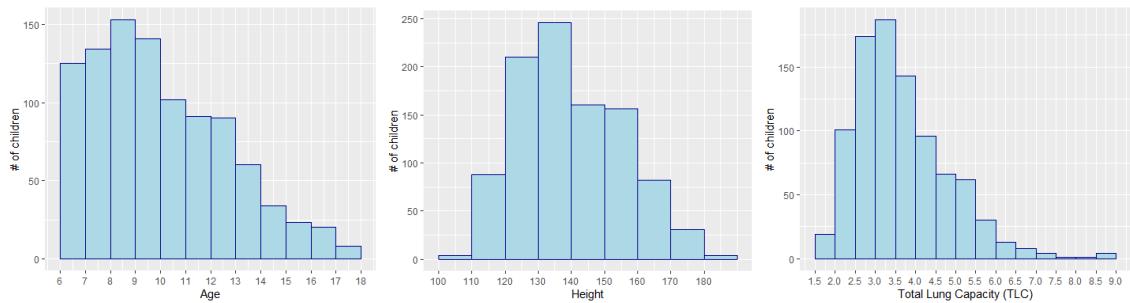

Figure S1: Distribution of participants according to age, height and total lung capacity. Age in years; height in centimetres; TLC in litres.

Table S1 shows the univariate comparisons of X and R parameters between height groups.

Table S2: Univariate comparisons of X and R parameters between sexes in 0.5 L steps. All numbers are shown as Median (IQR). Abbreviations: R8 insp = inspiratory resistance at 8 Hz; R8 exp = expiratory resistance at 8 Hz; R8 tot = total resistance at 8 Hz; X8 insp = inspiratory reactance at 8 Hz; X8 exp = expiratory reactance at 8 Hz; X8 tot = total reactance at 8 Hz; TLC = total lung capacity; M = males, F = females; n = number of participants; SD = standard deviation.

Table S3 shows the created reference values for male children and adolescents for the parameter Rexp at 8 Hz in the form of a look up table. In all the following tables, the 10<sup>th</sup>, 50<sup>th</sup> and 90<sup>th</sup> percentiles are shown in addition to the 5<sup>th</sup> and 95<sup>th</sup> percentiles usually used as lower limit of normal (LLN) and upper limit of normal (ULN). The L, M and S values are also shown, with which individual z-scores can be calculated.

Table S7: Look up table for Rtot at 8 Hz for male children and adolescents. Height in cm; 5<sup>th</sup>, 10<sup>th</sup>, 50<sup>th</sup>, 90<sup>th</sup> and 95<sup>th</sup> percentile.

Table S8 shows the created reference values for female children and adolescents for the parameter Rtot at 8 Hz in the form of a look up table.

Height	lambda	mu	sigma	5%	10%	50%	90%	95%

Table S9: Look up table for Xexp at 8 Hz for male children and adolescents. Height in cm; 5<sup>th</sup>, 10<sup>th</sup>, 50<sup>th</sup>, 90<sup>th</sup> and 95<sup>th</sup> percentile. Since X occurs in the range of negative values X parameters were shifted with the following function:  $f(x) = X * (-1) + 0.1$

Table S10 shows the created reference values for female children and adolescents for the parameter Xexp at 8 Hz in the form of a look up table.

Table S10: Look up table for Xexp at 8 Hz for female children and adolescents. Height in cm; 5<sup>th</sup>, 10<sup>th</sup>, 50<sup>th</sup>, 90<sup>th</sup> and 95<sup>th</sup> percentile. Since X occurs in the range of negative values X parameters were shifted with the following function:  $f(x) = X * (-1) + 0.1$

Table S11 shows the created reference values for male children and adolescents for the parameter Xinsp at 8 Hz in the form of a look up table.

Table S12: Look up table for Xinsp at 8 Hz for female children and adolescents. Height in cm; 5<sup>th</sup>, 10<sup>th</sup>, 50<sup>th</sup>, 90<sup>th</sup> and 95<sup>th</sup> percentile. Since X occurs in the range of negative values X parameters were shifted with the following function:  $f(x) = X * (-1) + 0.1$

Table S13 shows the created reference values for male children and adolescents for the parameter Xtot at 8 Hz in the form of a look up table.

Table S13: Look up table for Xtot at 8 Hz for male children and adolescents. Height in cm; 5<sup>th</sup>, 10<sup>th</sup>, 50<sup>th</sup>, 90<sup>th</sup> and 95<sup>th</sup> percentile. Since X occurs in the range of negative values X parameters were shifted with the following function:  $f(x) = X * (-1) + 0.1$

Table S14 shows the created reference values for female children and adolescents for the parameter Xtot at 8 Hz in the form of a look up table.

Table S15: Look up table for Ztot at 8 Hz for male children and adolescents. Height in cm; 5<sup>th</sup>, 10<sup>th</sup>, 50<sup>th</sup>, 90<sup>th</sup> and 95<sup>th</sup> percentile.

Table S16 shows the created reference values for female children and adolescents for the parameter Ztot at 8 Hz in the form of a look up table.

Table S16: Look up table for Ztot at 8 Hz for female children and adolescents. Height in cm; 5<sup>th</sup>, 10<sup>th</sup>, 50<sup>th</sup>, 90<sup>th</sup> and 95<sup>th</sup> percentile.

Table S17 shows the Pearson correlation coefficients between age, weight and height and all measured oscillometry parameters.

	<b>Mean</b>	<b>SD</b>	Mean Pearson correlation coefficient for each oscillometry parameter						
<b>Age</b>	<b>0.67</b>	<b>0.07</b>	0.71	0.73	0.73	0.56	0.61	0.6	0.73
<b>Weight</b>	<b>0.59</b>	<b>0.06</b>	0.63	0.64	0.64	0.49	0.57	0.54	0.65
<b>BMI</b>	<b>0.36</b>	<b>0.04</b>	0.38	0.39	0.39	0.29	0.37	0.33	0.39
<b>Height</b>	<b>0.69</b>	<b>0.06</b>	0.73	0.74	0.75	0.58	0.67	0.64	0.75
			<b>R8 exp</b>	<b>R8 insp</b>	<b>R8 tot</b>	<b>X8 exp</b>	<b>X8 insp</b>	<b>X8 tot</b>	<b>Z8 tot</b>

Table S17: Pearson correlation coefficients between age, weight and height for all oscillometry parameters together and separated for Rexp, Rinsp, Rtot, Xinsp, Xexp, Xtot and Ztot.

Figure S2 shows the reference values of Ducharme et al. from 2022 for Rtot and Xtot at 8 Hz applied to the current LEAD cohort.

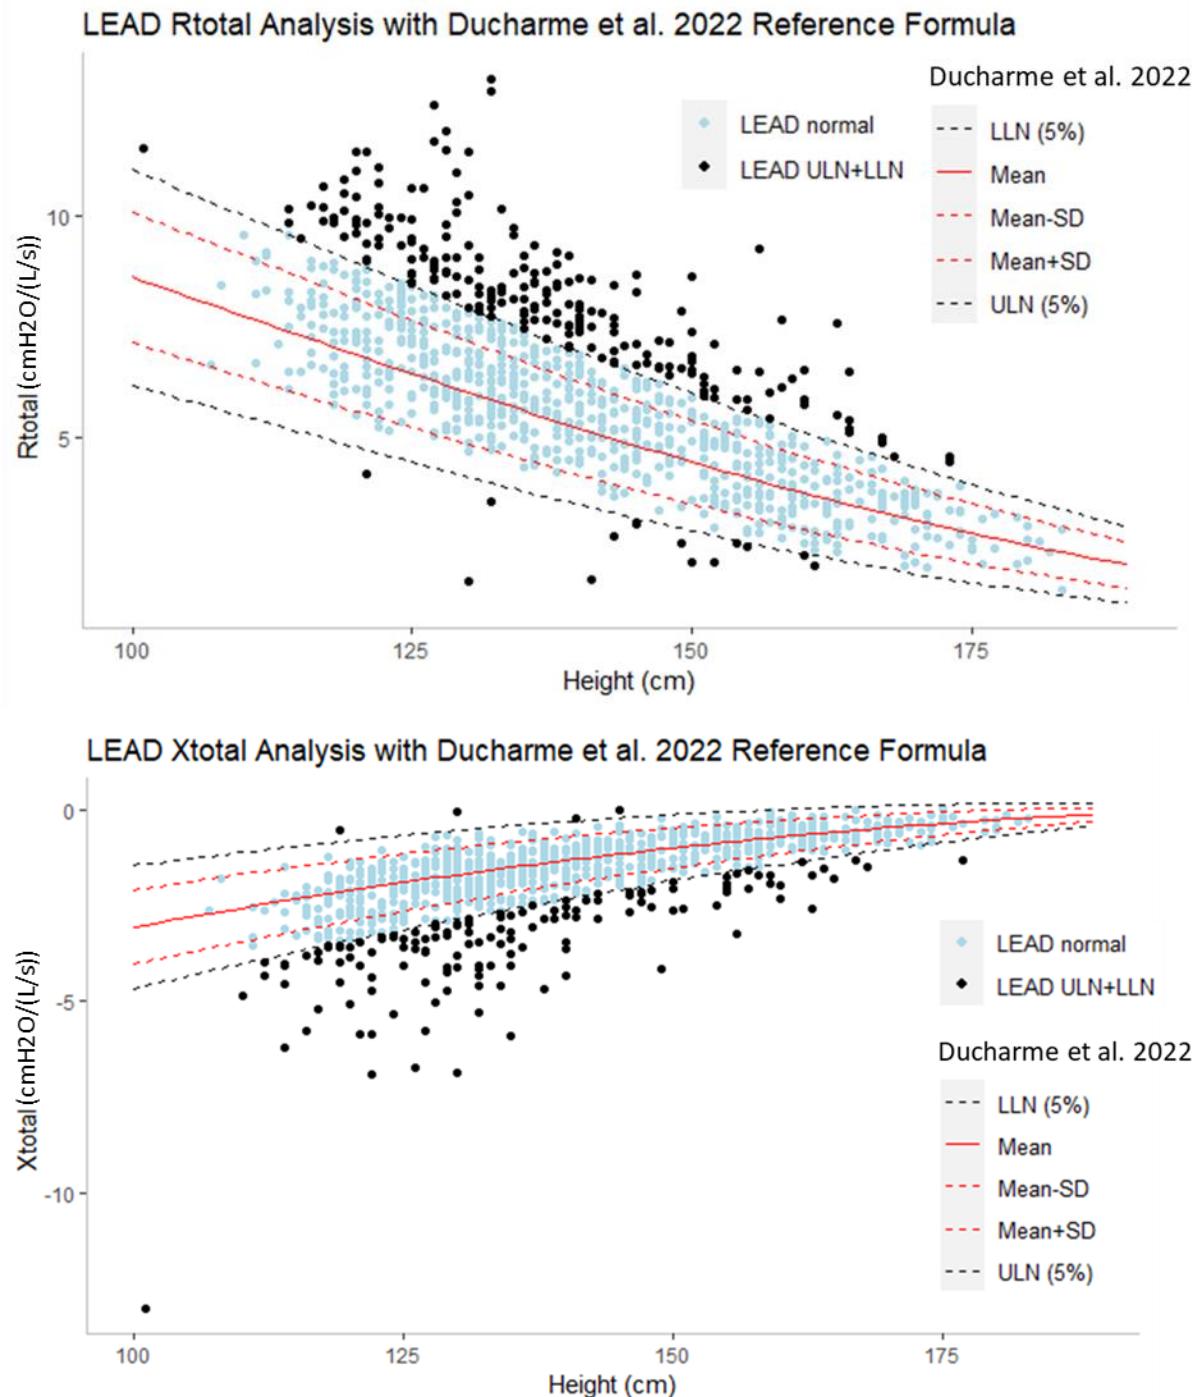

Figure S2: Application of the reference values of Ducharme et al. from 2022 for Rtot and Xtot at 8 Hz applied to the current LEAD cohort.

Figure S3 shows the sensitivity analysis with regard to high minute ventilation.

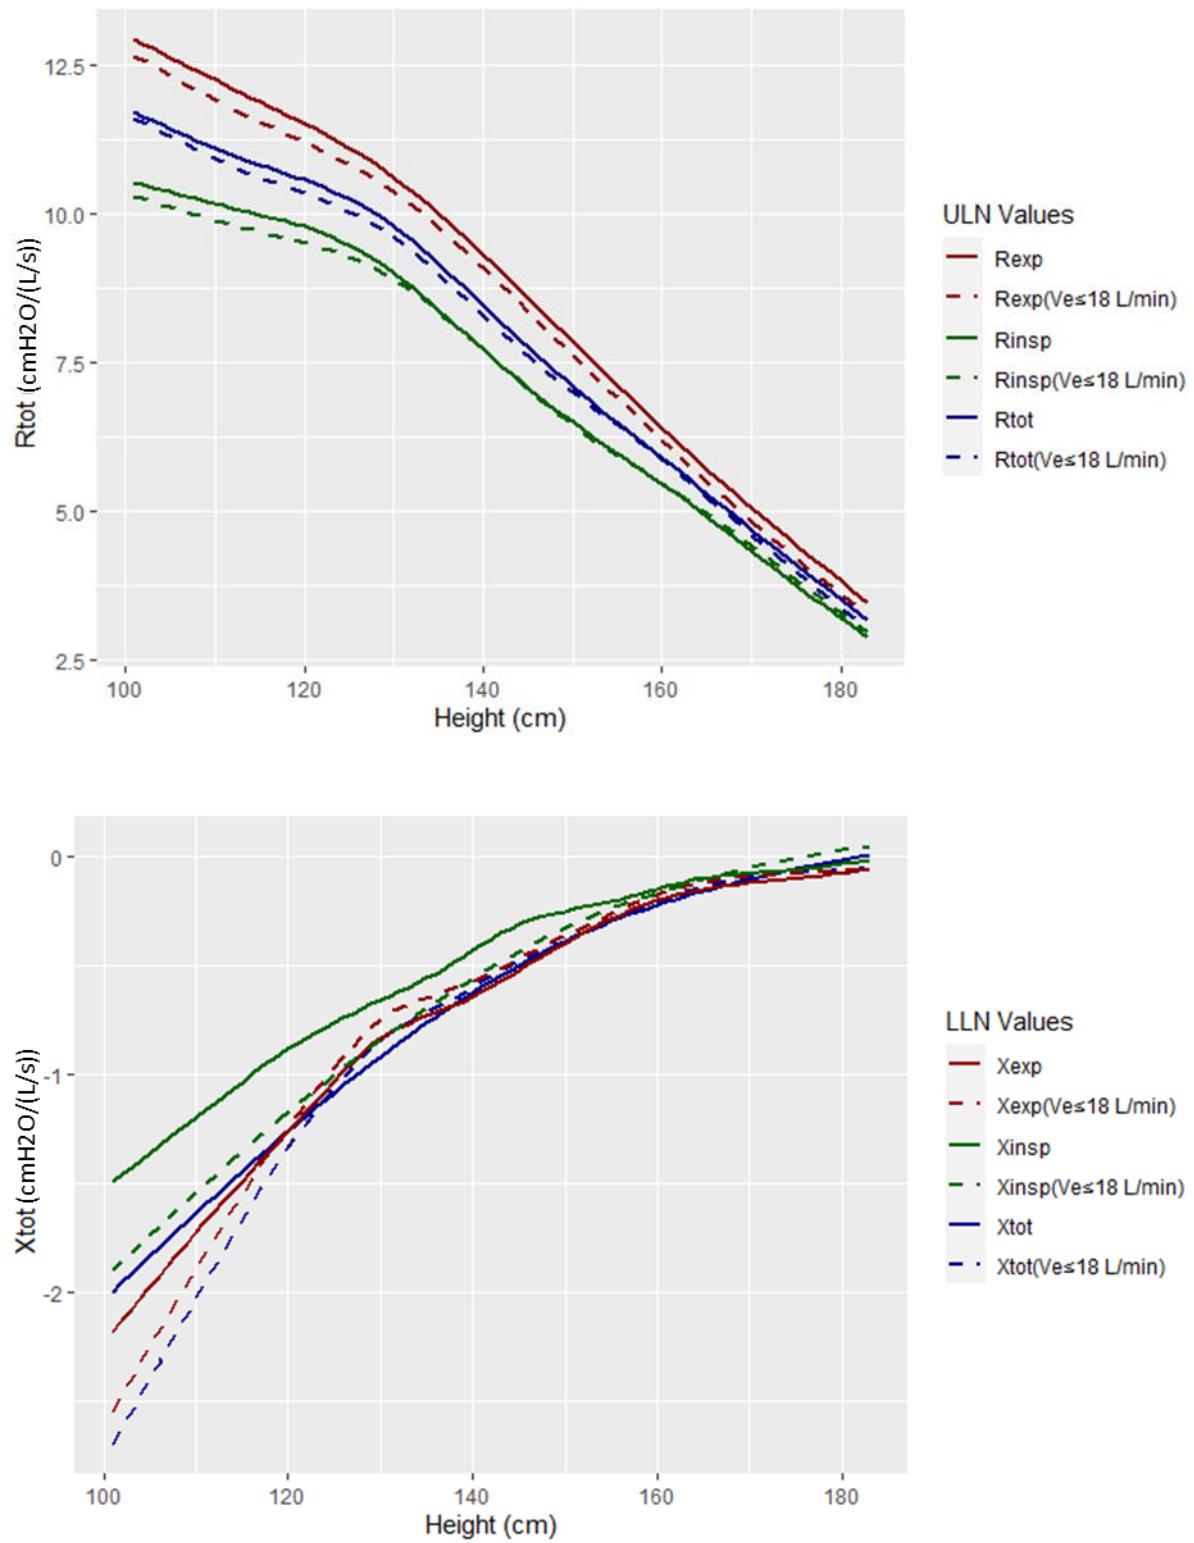

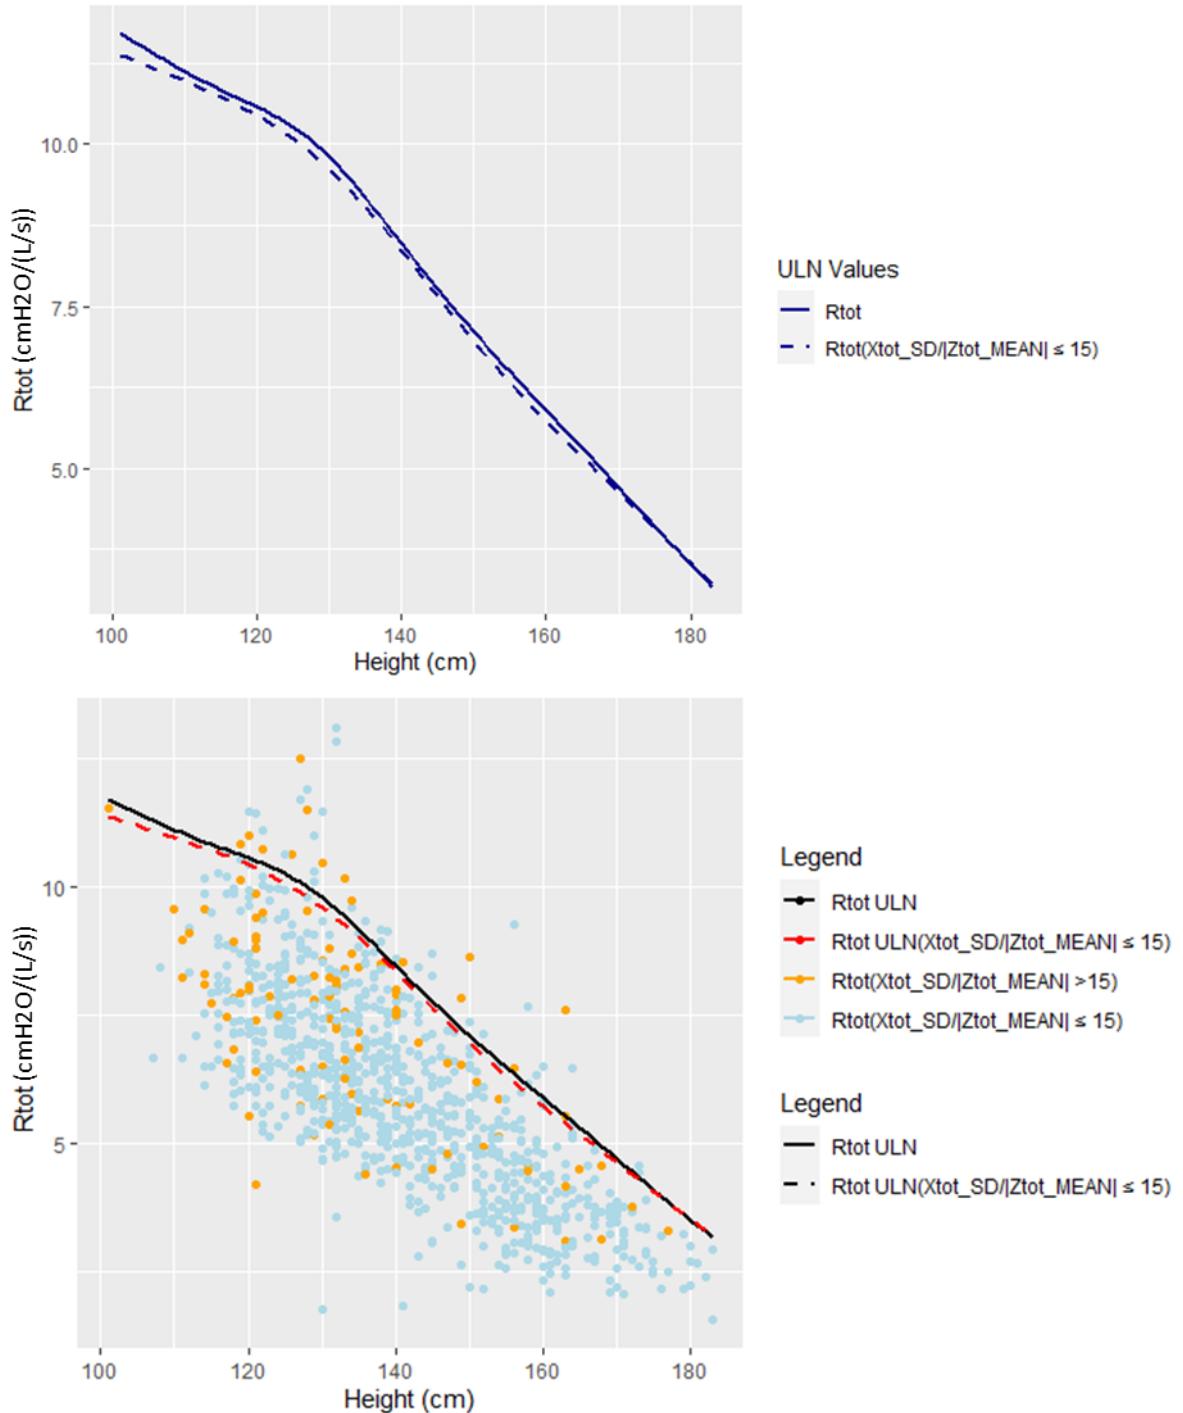

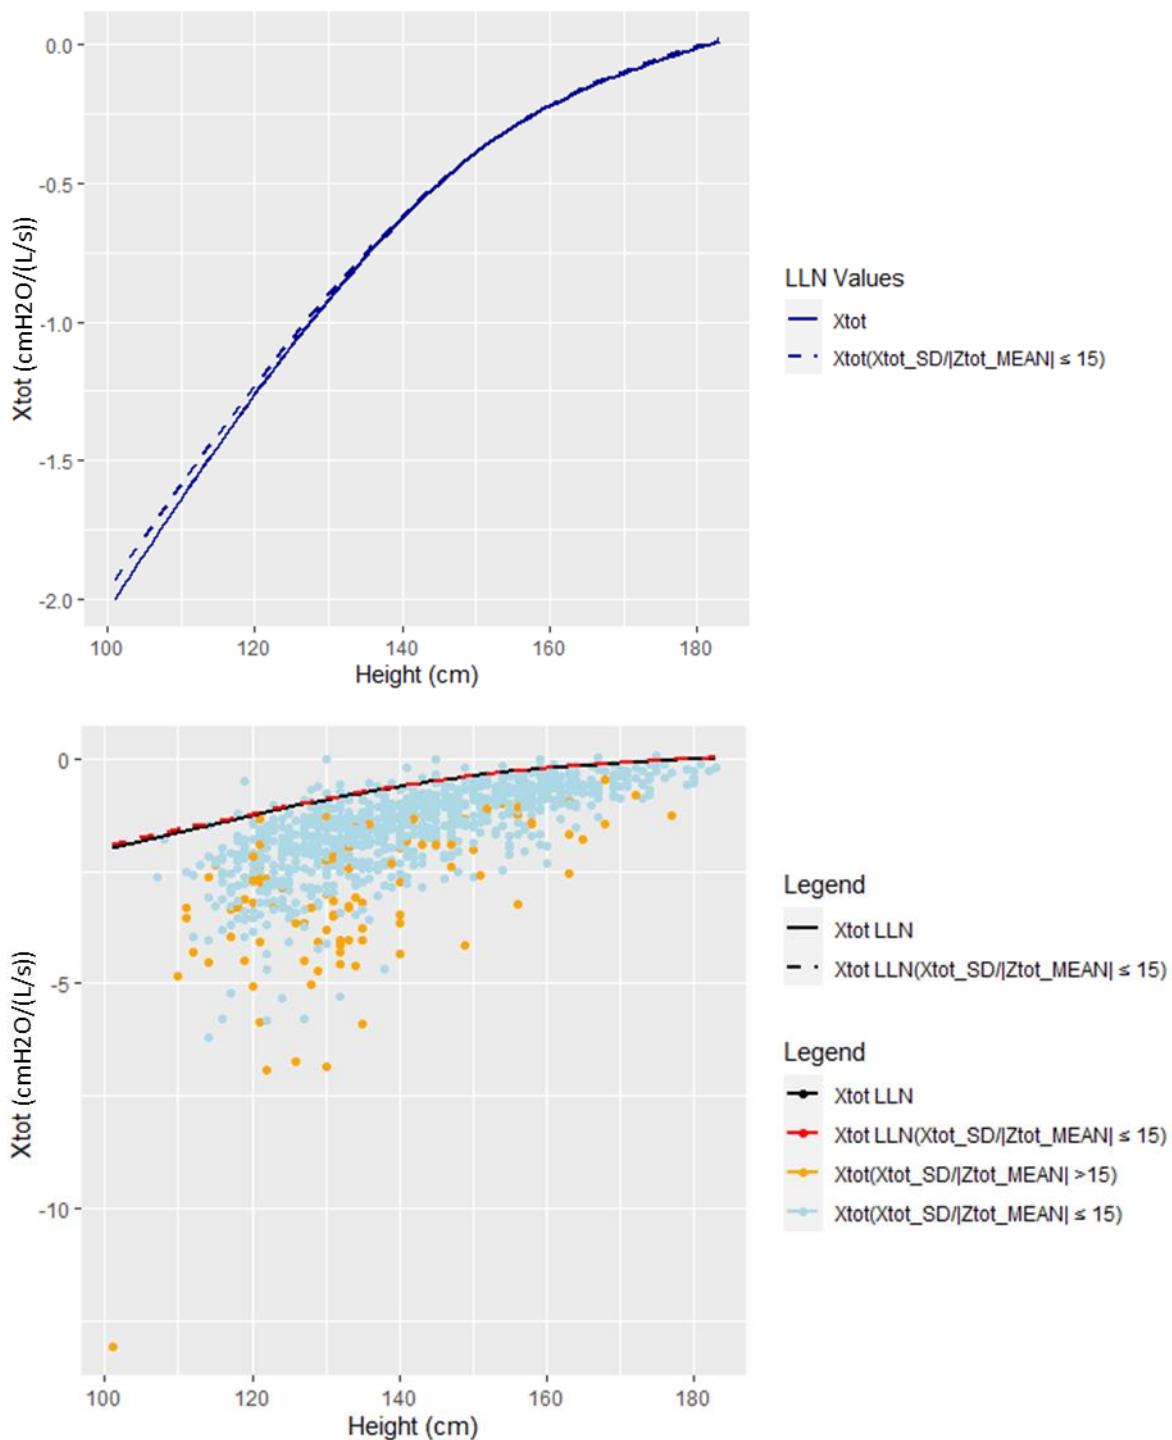

Figure S3: sensitivity analysis considering susceptibility to different levels of breathing flows

Figure S4a shows the sensitivity analysis with regard to residual artifacts not filtered by the device by applying a threshold on the intrabreath CoV of Xtot of 15%.

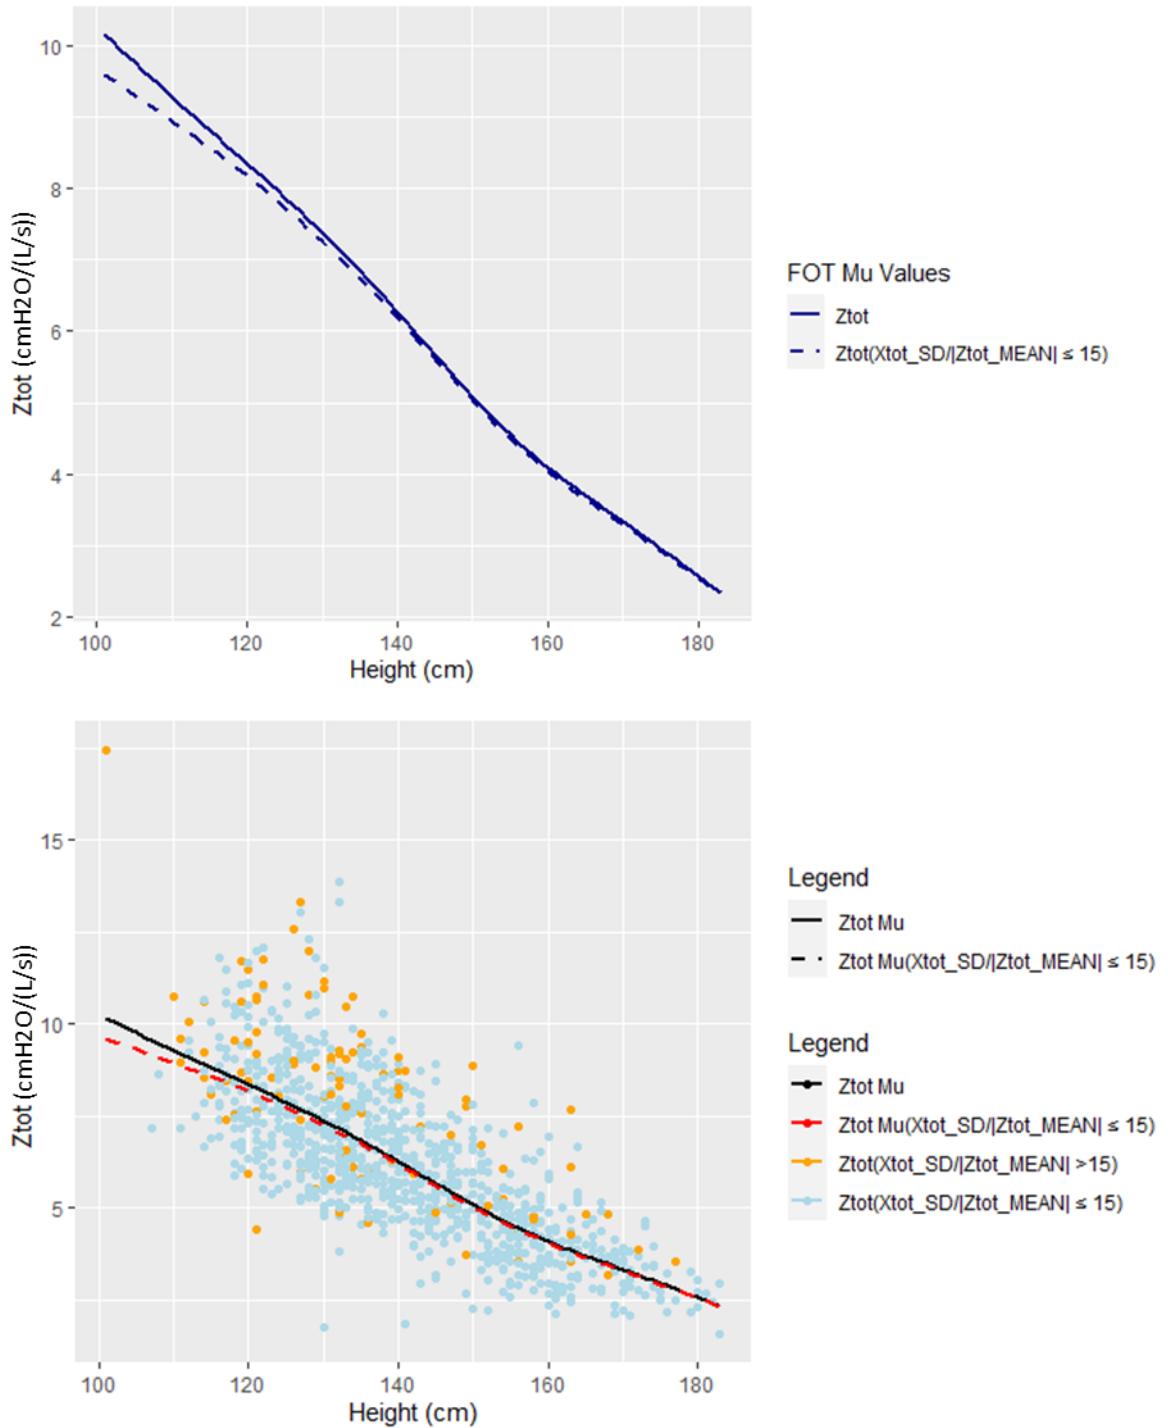

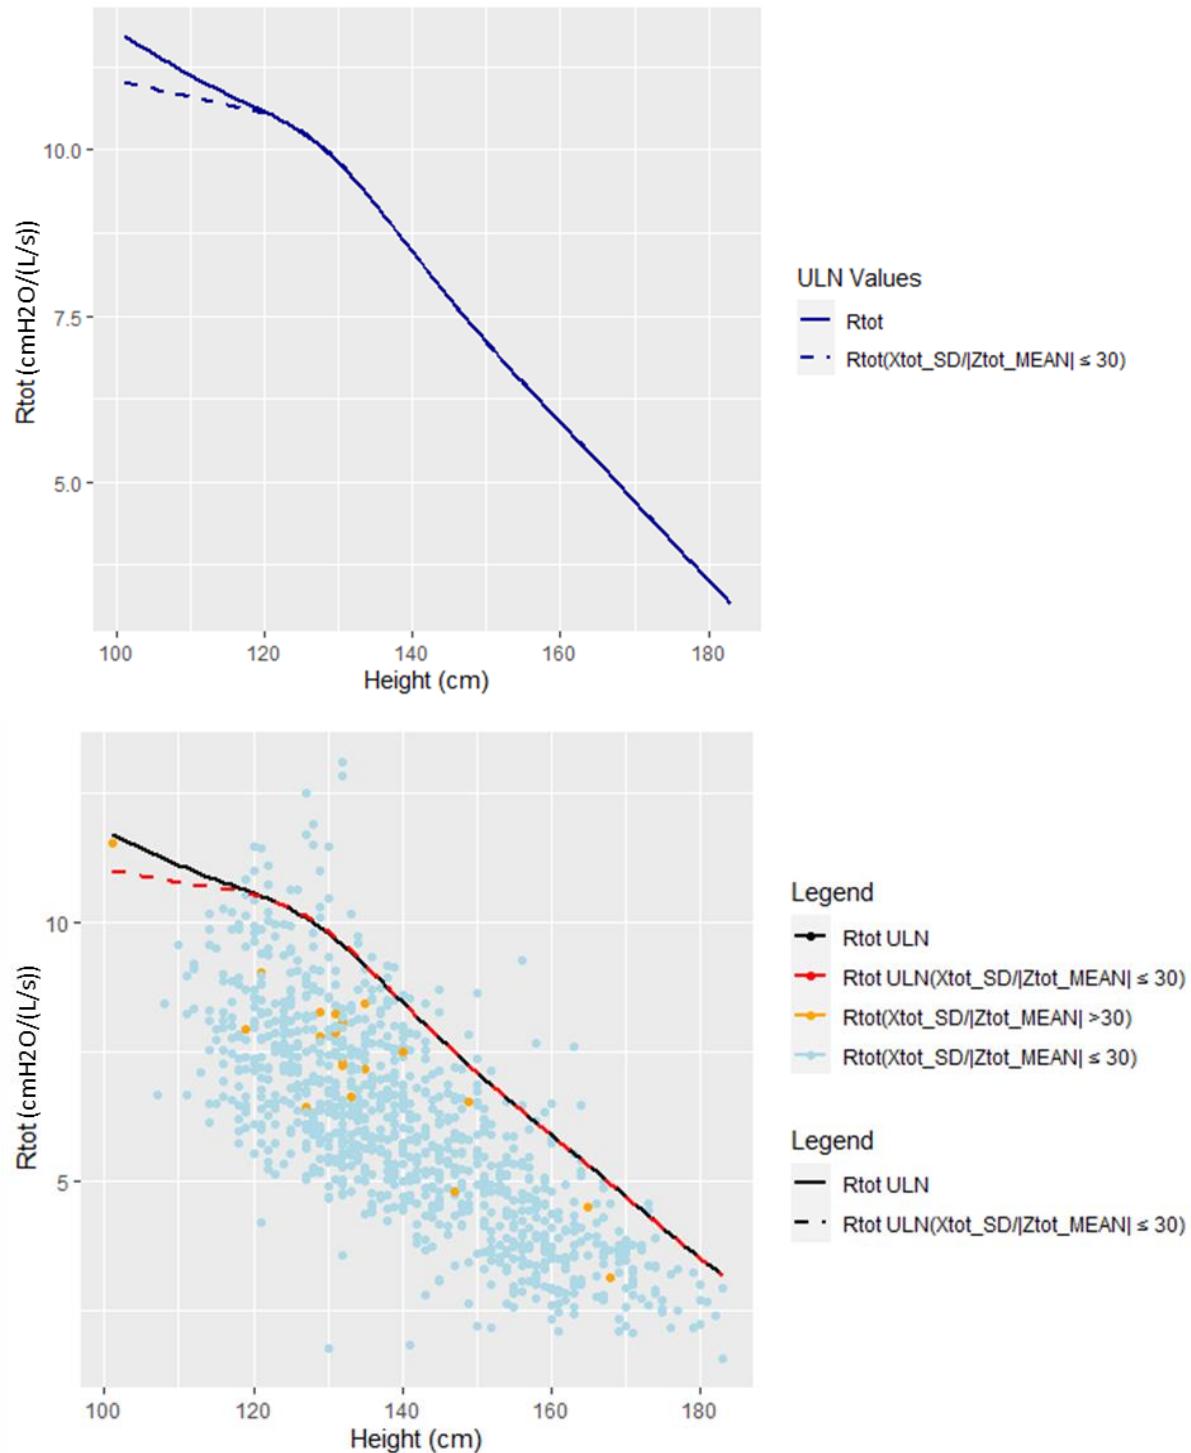

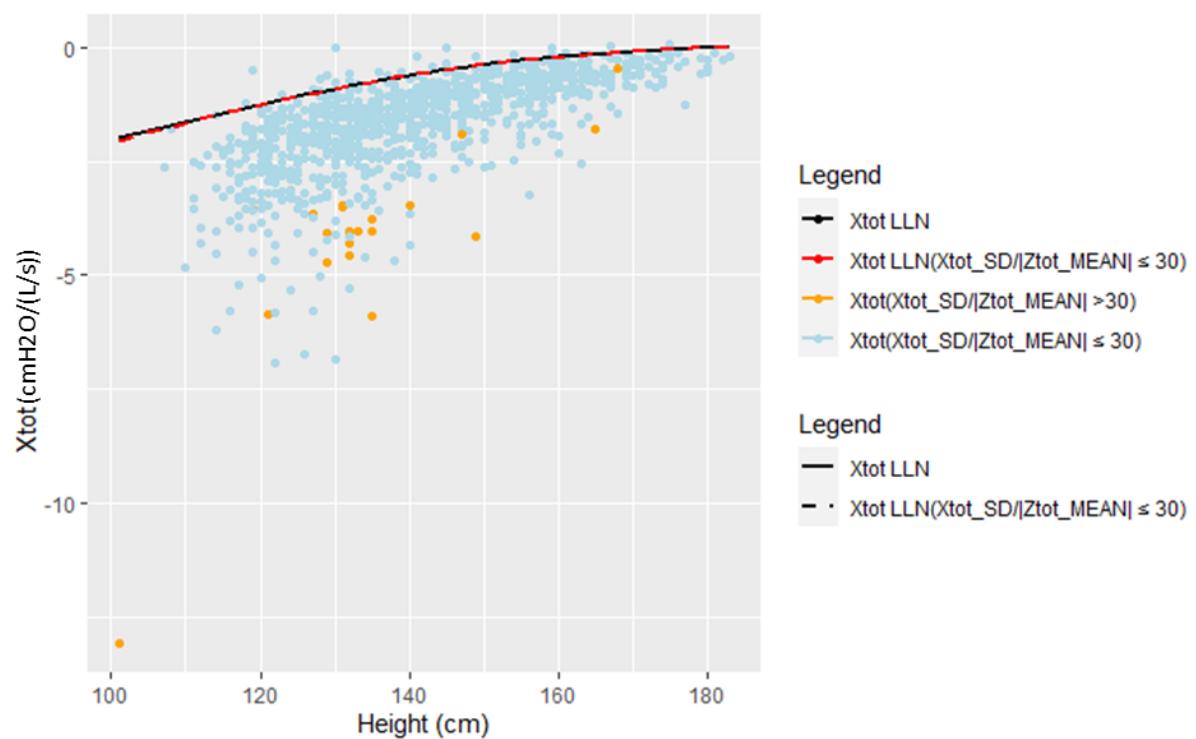

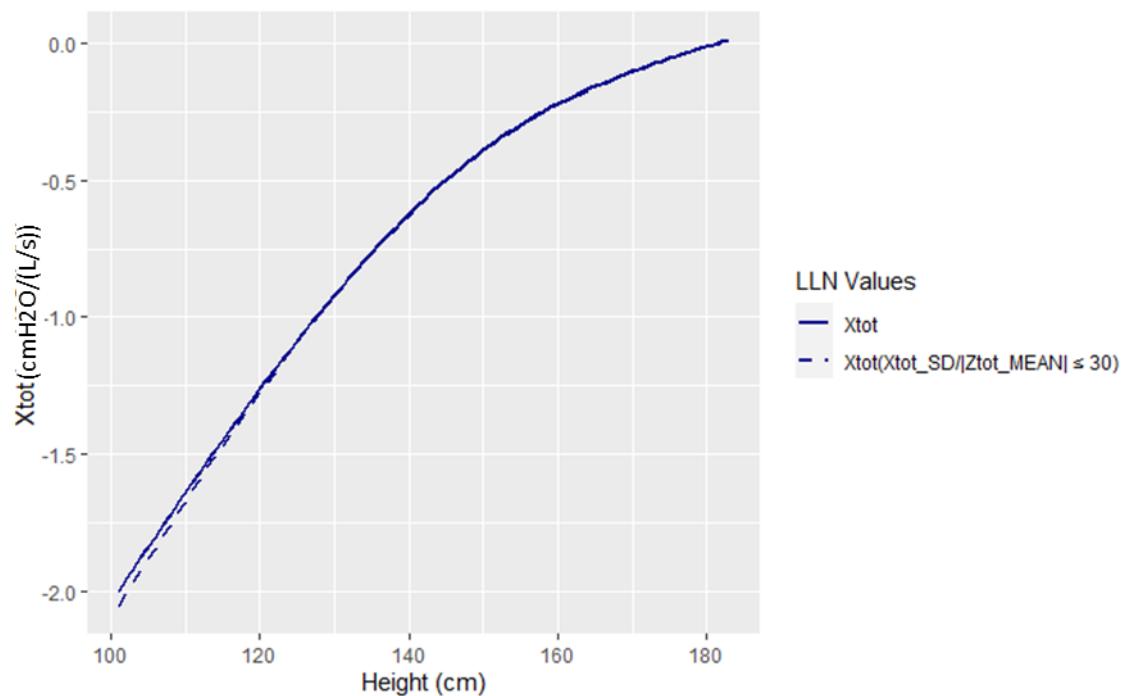

Figure S4a: sensitivity analysis considering susceptibility to artifacts not filtered by the device by applying a CoV of  $X_{tot}$  of 15%.

Figure S4b shows the sensitivity analysis with regard to residual artifacts not filtered by the device by applying a threshold on the intrabreath CoV of Xtot of 30%.

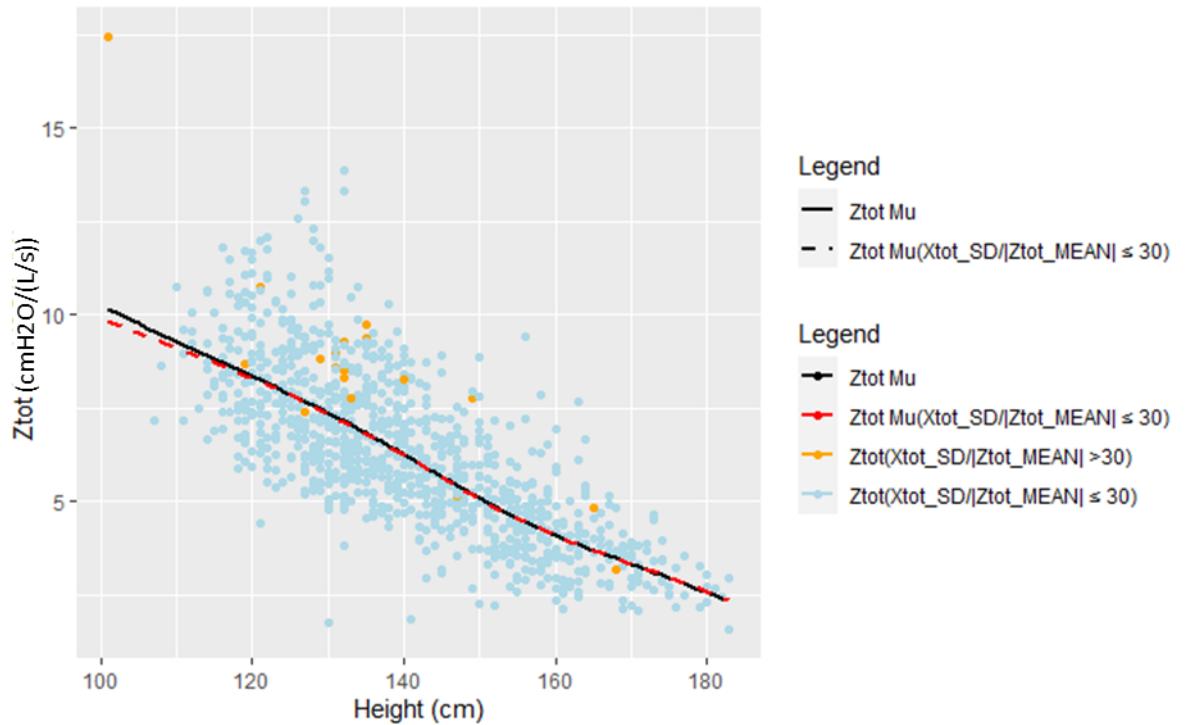

Figure S4b: sensitivity analysis considering susceptibility to artifacts not filtered by the device by applying a CoV of Xtot of 30%.
