

Supplementary Figure 1. gB2 ELISA titers are induced by CJ2-gD2

Female BALB/c mice were immunized intramuscularly twice (T=0d and T=28d) with 10^{10} vp/mouse with Ad35.HSV.gD2 (N=10/group) or twice (T=0d and T=28d) with 7×10^5 pfu/mouse CJ2-gD2 (N=10) or mock immunized with formulation buffer (N=10) and sacrificed 6 weeks after the first immunization. Serum samples were collected (T=42d) and analyzed for gB2 IgG ELISA titers (shown as log₁₀ endpoint titers). Dotted line indicates the limit of detection (LOD) and horizontal lines indicate the mean value per group.
