The stilbenoids in the HC-030031 binding pocket of hTRPA1

Since there is no experimental HC-030031–hTRPA1 complex available, we studied the stilbenoids binding to that antagonistic site based on the hTRPA1 cryo-EM structures with the analogous xanthine (cpd 3-60) and hypoxanthine (cpd 21) derivatives. The reference cpd 21 and the stilbenoids were docked to the cpd 21 site in the closed-state cryo-EM structure of hTRPA1 (PDB ID: 7JUP) and cpd 3-60 and the stilbenoids to the cpd 3-60 site in the intermediate-state hTRPA1 structure (PDB ID: 7OR0). Of note, the xanthine/hypoxanthine moiety of cpd 3-60 and cpd 21 share the same position, stacking strongly with Trp711, but then the rest of the compounds directs to different sides (subsites) of the pocket (Figure S3A, p. S9).

The predicted binding affinity of the stilbenoid compounds for the antagonist site (both subsites) was less strong (the more negative value means stronger interaction) than that for the A-967079 pocket when comparing their Prime/MM-GBSA ΔG -bind values (Table S4, p. S10). At the cpd 21 subsite, while the stilbenoids positioned similarly to cpd 21, they shared only one interaction with the reference (π - π stacking with Trp711). Although the stilbenoid glucosides formed more H-bond interactions with hTRPA1 than cpd 21, they did not demonstrate a comparable binding free energy to compound 21. At the cpd 3-60 subsite, all of the stilbenoids, except for isorhapontin, interacted with Trp711. However, only isorhapontin shared a similar position with cpd 3-60 and showed a better Prime/MM-GBSA ΔG -bind value compared to the other stilbenoids. None of the stilbenoids formed H-bond interactions with Asn855. It appears that the aglycone stilbenoids are notably small for this binding site, unable to fill either of the subsites. This is reflected in their less negative (weaker) binding free energy values at this site.

For comparison, we also docked HC-030031 into both subsites of this large antagonistic pocket. Even though HC-030031 aligned with cpd 21's position (Figure S3C) and mostly mimicked its interactions, it could only interact with Asn855 (a key amino acid for HC-030031 binding identified in mutational studies) in the cpd 3-60 subsite. The xanthine and acetamide moieties of HC-030031 and cpd 3-60 were well superimposed, forming interactions with Trp711 and Glu854 (bb) and Asn855, but the rest of molecules did not align (Figure S3B).

Figure S3. (A) Experimental binding poses of cpd 21 (cyan sticks) and cpd 3-60 (white sticks) in the HC-030031 pocket at their respective subsites of hTRPA1 (green and cyan cartoon; subunits with different colors) (PDB IDs: 7JUP and 7OR0 superimposed, the protein structure of 7JUP is hidden for clarity). (B) The docked pose of HC-030031 (orange sticks) compared to the experimental pose of cpd 3-60 (white sticks) (PDB ID: 7OR0). (C) The docked pose of HC-030031 compared to the experimental pose of cpd 21 (cyan sticks) (PDB ID: 7JUP). Atom color code: nitrogen – blue; oxygen – red; fluorine – light blue; sulphur – gold; hydrogen – white. The key residues (in lines) and the TM domains are labelled. Interaction color code (dashed lines): H-bond – red; π - π – blue.

Table S4. Docking results of the stilbenoids at the antagonistic HC-030031 binding site of hTRPA1 (PDB ID: 7JUP; 7OR0)

Compounds	Prime/MM-GBSA		Interactions	
	ΔG -bind (kcal/mol) ^[a]		H-bond ^[b] / π - π interactions	
	cpd 21 subsite	cpd 3-60 subsite	cpd21 subsite	cpd 3-60 subsite
Resveratrol	-43.35	-44.87	Glu854, Arg852 (bb) /Trp711	Arg852 (bb), Lys704 (bb) /Trp711
Pinosylvin	-48.80	-44.61	Glu854 (bb), Ile858 (bb) /Trp711	Lys704 (bb) /Trp711
PME	-53.67	-44.60	Glu854 (bb), Ile858 (bb) /Trp711	Arg852 (bb) /Phe853, Trp711
Astringin	-59.04	-45.36	Glu854, Arg852 (bb), Arg975, Lys704 (bb) /Trp711	Glu854, Lys704 (bb) /Trp711
Isorhapontin	-67.25	-52.72	Glu854 (bb), Arg852 (bb), Met978 (bb), Gln979	Leu707 (bb), Gln979/Phe853
HC-030031	-77.09	-60.79	His983, Glu854(bb)/Trp711	Glu854 (bb), Asn855/Trp711
cpd 21	-83.18 ^[c]	-	His983, Gln979/Trp711	-
cpd 3-60	-	-72.26 ^[d]	-	Glu854 (bb), Asn855, Val875 (bb) /Phe853, Trp711

[a] To be able to compare the experimental complexes and the docking results at the cpd 21 and cpd 3-60 subsites, Prime/MM-GBSA binding free energies were calculated for all the docked complexes. [b] Hydrogen bond formed with the polar side chain atoms of the residue if not marked with bb (backbone atom). [c] Binding free energy of the experimental complex (PDB ID: 7JUP). [d] Binding free energy of the experimental complex (PDB ID: 7OR0).

The stilbenoids in GNE-551 binding pocket of hTRPA1

Since the *in vitro* study by Nakao et al. (Nakao et al., 2017) demonstrated that stilbenoids can indeed activate hTRPA1 channel and may subsequently inhibit the channel through a desensitization mechanism, we also explored the possibility that stilbenoids may interact with the other known agonistic site apart from the shared agonist/antagonist site of A-967079. Therefore, we docked the natural substances into the GNE-551 binding site using the same hTRPA1 structure as for the docking studies at the A-967079 site as there was no significant difference in docking scores/ interactions of GNE-551 in that structure compared with the original GNE-551–hTRPA1 complex structure (PDB ID: 6XJ2, see Table S5). Pinosylvin and PME exhibited similar binding poses, interacting with Gln940 and Phe841, whereas the pose of resveratrol was somewhat shifted to form an additional H-bond interaction with Ser943. Although astringin and isorhapontin were forming hydrogen bonds with many same residues (Table S5), their poses were noticeably distinct from each other. However, while all natural compounds were able to interact with at least some of the key residues important for agonist binding, astringin's orientation and position was closest to that of GNE-551, and its many hydrogen bonding interactions contribute especially to the Glide XP docking score (Figure 4E, F; Table S5). Further, the stilbenoids, specifically aglycons, are not sufficiently bulky to make use of all the possible interactions in the GNE-551 pocket, which is also reflected in the free energy of binding values compared to those in the A-967079 binding pocket. Based on the interactions, docking scores, and the binding free energy values, it appears that the stilbenoids show a higher affinity to agonistic/antagonistic pocket (TM5-PH1-TM6) than the agonistic pocket (GNE-551 binding site).

Table S5. Docking results of the stilbenoids at the agonistic GNE-551 binding site of the intermediate-state hTRPA1 (PDB ID: 3J9P, MD frame saved at 7 ns)

Compounds	XP GScore (kcal/mol)	Prime/MM-GBSA ΔG_{bind} (kcal/mol)	H-bond	π - π interaction
Resveratrol	-5.73	-53.00	Gln940, Ser943	Phe841
Pinosylvin	-4.23	-44.90	Gln940	Phe841
PME	-4.34	-44.10	Gln940	Phe841
Astringin	-7.81	-52.71	Gln940, Ser943, Asn798, Tyr799 (bb), Met801 (bb)	-
Isorhapontin	-4.04	-43.05	Tyr840, Ser943, Asn798, Tyr799 (bb)	-
GNE-551	-5.25/-5.63 ^[a]	-66.83/-56.9 ^[a] / -68.55 ^[b]	Tyr840 ^[c]	Tyr840, Phe841 ^[c]

[a] The corresponding values of the redocked GNE-551 in the original GNE-551–hTRPA1 cryo-EM complex (PDB ID: 6X2J). [b] Binding free energy value for the original GNE-551–hTRPA1 cryo-EM complex. [c] Same interactions when redocked to PDB ID: 6X2J; see Table S1 for the interactions of the experimental complex).

Table S6. Docking results of resveratrol at the A-967079 (antagonist) and GNE-551 (agonist) binding sites of intermediate-state hTRPA1 (PDB ID: 3J9P, MD frame saved at 7 ns) and the rTRPA1 model

Compounds	hTRPA1 binding site		rTRPA1 binding site	
	A-967079	GNE-551	A-967079	GNE-551
Prime/MM-GBSA ΔG-bind (kcal/mol)				
Resveratrol	-54.97	-53.00	-56.78	-44.85
A-967079	-44.22	-	-55.59	-
GNE-551	-	-66.83	-	-55.68

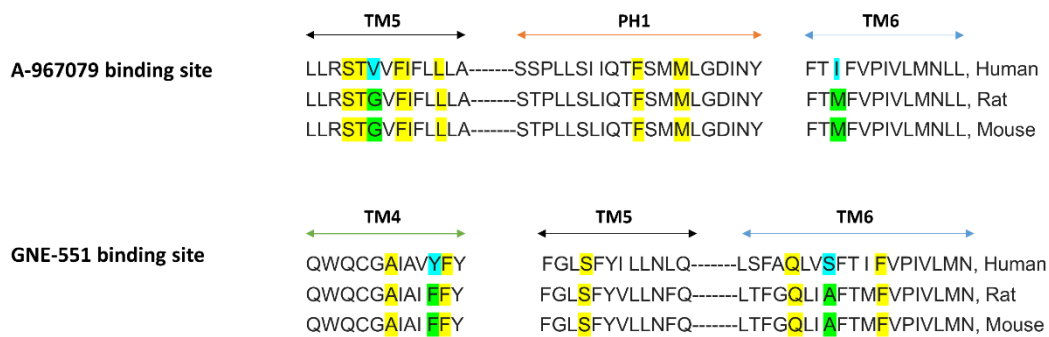

Figure S4. Sequence alignment of human, rat and mouse TRPA1 for A-967079 and GNE-551 binding sites.

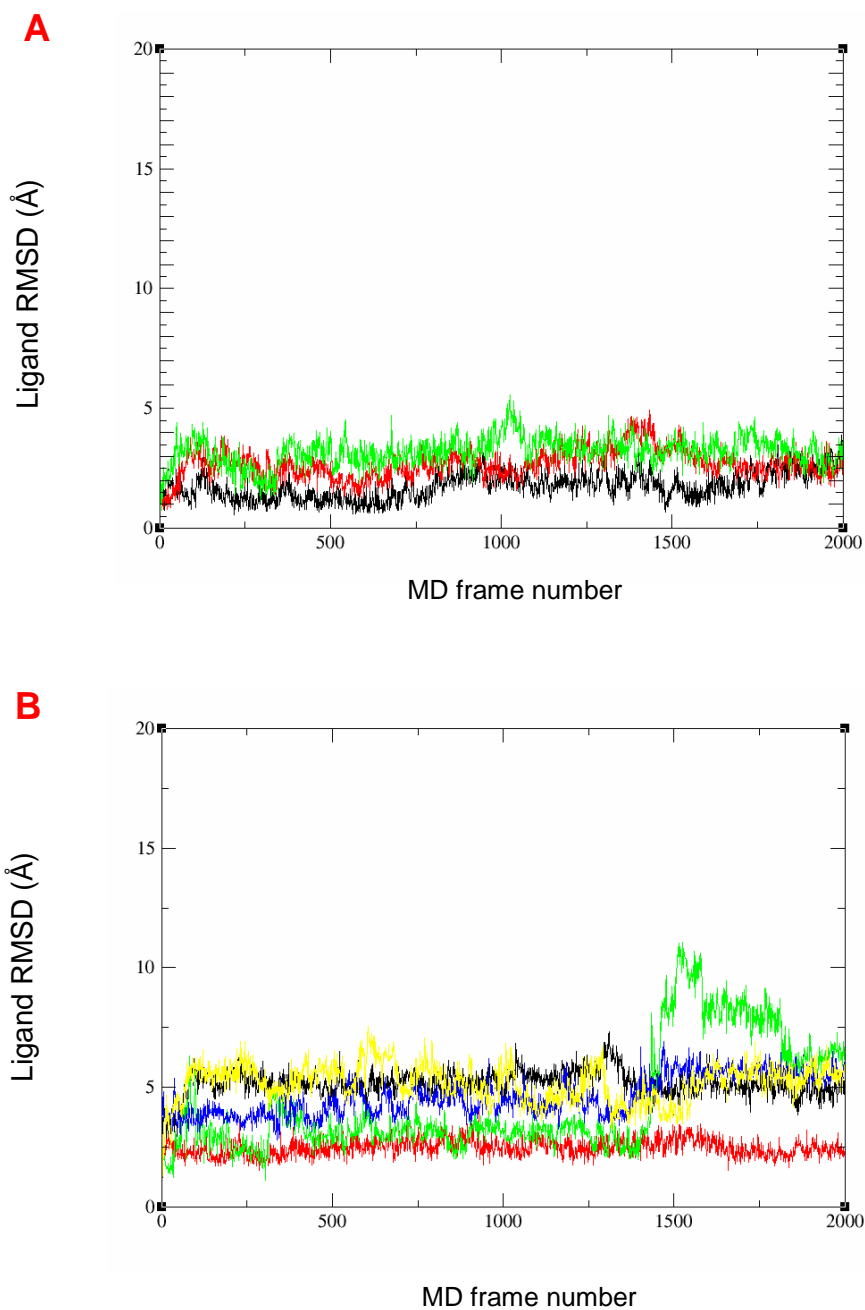

Figure S5. Ligand RMSD plots of GNE-551 in its binding site at (A) hTRPA1 (PDB ID: 6X2J) and (B) the rTRPA1 model during repeated (parallel) 400-ns molecular dynamics (MD) simulations. Every color represents the ligand RMSD during an individual simulation. Snapshots of the MD trajectory (frames) were saved at every 200 ps.

Figure S6.
