

CORRIGENDUM

In the paper by ERIC FOSS, RUSSELL LANDE, FRANKLIN W. STAHL and CHARLES M. STEINBERG (*GENETICS* **133**: 681–691; March, 1993) entitled “Chiasma interference as a function of genetic distance,” the authors wish to change the final sentence of the RESULTS AND DISCUSSION (page 687) to read: The estimate of 0.2 is based on studies of the *rosy* locus, which is only 5 centimorgans from the centromere of chromosome *III*. If our speculation regarding a string of Co events near the centromere is correct, the estimate $m = 4$ based on the fraction of C's that are Cx's is apt to be an overestimate. A future publication will describe the probable magnitude of the overestimate and its implication for this alternative model. The conclusions of the primary model presented here are independent of the *rosy* map position.

In addition, the first line of the last equation on page 689 should be $S_4 = [(1 - p)/p_x]^2 P_{Co-Co}$.
