## Supplementary Figure 7

## RAD21 Ab1

**Supplementary Fig. 7** | Single labelling of spermatocyte chromosome spreads using RAD21 Ab1. Representative cells are shown in temporal order. (A) leptonema. (B) Zygonema: note the more intensive staining in regions of synapsed chromosomes (arrow). (C) Pachynema, note the stronger staining in the early pachytene cells (upper left) when compared to that in an adjacent pachytene cell with more condensed chromosomes (lower right). A nucleus of much smaller size was also stained intensively (arrowhead). (D) Diplonema, with an enlarged view of a selected chromosome (boxed) showing the strong staining in the ends of the chromosomes. (E) Metaphase I/anaphase I, with an enlarged view showing the staining in the centromeres of homologous chromosomes. (F) Anaphase II. Note several rod-shaped structures. Bar =  $10 \mu m$ .
