

Table 3. Neandertal human remains (1997–2000)

No.	Element	Description
NN 1*	Humerus, right Not Neandertal 1	Splinter of lateral midshaft, maximum length 107.4 mm (proximal--distal), maximum breadth 19.1 mm. Large segments of deltoid tuberosity and greater tubercle crest. (Conjoins with 2, 3, 47)
NN 2*	Humerus, right Not Neandertal 1	Splinter of ventral midshaft, maximum length 110.6 mm (proximal--distal), maximum breadth 20.3 mm. Portions of greater tubercle crest, intertubercular groove, and lesser tubercle crest. (Conjoins with 1, 3, 47)
NN 3*	Humerus – right Not Neandertal 1	Splinter of posterior midshaft, maximum length 57.5 mm (proximal--distal), maximum breadth 13.7 mm. (Conjoins with 1, 2, 47)
NN 4	Tibia, right	Ventral midshaft segment, maximum length 70.4 mm (proximal--distal), maximum breadth 20.2 mm. Segment of anterior margin. [Conjoins with 23]
NN 5	Tibia, right	Ventral shaft with tibial tuberosity and anterior margin, maximum length 42.2 mm (proximal--distal), maximum breadth 33.2 mm. [Conjoins with 48]
NN 6	Humerus, left (?)	Proximal articular surface (head). Maximum dimensions 41.1 × 34 mm.)
NN 7	Cervical vertebra	Probable C-6. Complete except for spine and lateral transverse processes. Total breadth 51.2 mm.
NN 8	Rib fragment	Right (?), below angle; preserves costal groove. Maximum length 45.5 mm. [Conjoins with 12]
NN 9	Rib fragment	Maximum length 60.6 mm.
NN 10	Rib fragment	Right, near angle with costal groove. Maximum length 47.9 mm.
NN 11	Rib fragment	Small piece with section removed. Dimensions 11 × 15.9 mm.
NN 12	Rib fragment	Right (?), maximum length 30.9 mm. [Conjoins with 8]
NN 13	Femur, left. Neandertal 1	Piece of lateral femoral condyle (29.8 × 12.3 mm dimensions on articular surface). Fits on Neandertal 1.
NN 14†	Innominate, right	Adult ischium with ischial tuberosity and articular surface of acetabulum. Maximum dimensions 76.5 mm (cranio--caudal) × 48 mm.
NN 15	Sacrum	Left articular process for L5. Maximum dimensions 21 × 14.4 mm.
NN 16	Maxillary molar, left	Permanent complete M ¹ or M ² . Moderate to heavy occlusal and interproximal wear. Mesial interproximal groove.
NN 17	Cervical vertebra	Right inferior articular surface of atlas. Maximum dimensions (articular facet) 20.5 × 17.1 mm.
NN 18	Cervical vertebra	Left articular process of C3-6. Maximum dimensions 17.3 × 15 mm.
NN 19	Sphenoid	Right adult sphenoid body with elongated sphenoid sinus. Maximum dimensions 34.4 (anteroposterior) × 17.9 mm.
NN 20	Metacarpal II, right	Proximal articular surface with large part of shaft. Adult. Maximum length 53 mm.
NN 21	Capitate, left	Complete, adult. Maximum dimensions 23.5 × 17.8 mm.
NN 22	Cuneiform III, right	Dorsal part of lateral cuneiform of adult. Maximum proximal--distal dimension 23.8 mm.
NN 23	Tibia, right	Anterior shaft frequent. Maximum proximal--distal dimension 49.2 mm, maximum breadth 19.9 mm. [Conjoins with 4]
NN 24*	Humerus, right	Distal metaphysis. Epicondyles with superior olecranon fossa and

No.	Element	Description
	Not Neandertal 1	medial epicondylar ridge. Maximum dimensions 85.4 mm. (proximal--distal) × 47.1 mm.
NN 25	Tibia, right (?)	Shaft fragment. Maximum dimensions 137.9 mm (proximal--distal) × 22 mm.
NN 26	Cervical vertebra	Body with left articular facets and lamina C 5-7. [Conjoins with 27]
NN 27	Cervical vertebra	Right articular facets and lamina C 5-7. [Conjoins with 26]
NN 28	Metacarpal II or III, left (?)	Shaft fragment lacking both articular surfaces. Maximum length 40 mm.
NN 29	Manual phalanx	Distal row. Adult. Right ray 2 (?). Maximum length 21. 7 mm.
NN 30	Manual phalanx, left	Proximal row, complete except ulnar side of head. Ray 5. Maximum length 33. 6mm.
NN 31	Maxillary molar, right	Complete permanent M ² . Moderate occlusal and distal interproximal wear. Heavy mesial interproximal wear.
NN 32	Manual phalanx, left	Pollex, proximal row. Maximum length 31.3 mm.
NN 33	Maxillary molar, left	Permanent M ³ . Light to moderate occlusal and mesial interproximal wear. No distal interproximal facet. Complete except lingual root.
NN 34	Facial fragment Neandertal 1	Left zygomatic with adhering maxillary body, including lateral maxillary sinus. Maximum dimensions 66.2 mm. × 54.3 mm. Internal sinus pathology. Fits on Neandertal 1 .
NN 35	Temporal, right Neandertal 1	Fragment just posterior to mastoid process - portion of digastric groove and sigmoid sinus sulcus (interior) preserved. Maximum anterior-posterior length 40.6 mm. Fits on Neandertal 1 .
NN 36	Innominata	Acetabular fossa with small segment of lunate articular surface rim. Maximum dimensions 29.3 × 24.9 mm. Right (?).
NN 37	Lunate, left	Complete, adult specimen. Maximum dimensions 16.8 × 20.1 mm.
NN 38	Calcaneus (?)	Right (?) with portion of tuberosity.
NN 39	Rib fragment	Right (?), just ventral to tubercle. Maximum length 36.4 mm.
NN 40	Occipital	Right portion of adult nuchal plane with foramen magnum rim. Maximum dimensions 36.5 mm × 25.1 mm.
NN 41	Human (?)	Proximal ulnar segment (?). Maximum dimensions 23 × 18.3 mm.
NN 42 [‡]	Ulna, right Not Neandertal 1	Shaft fragment, maximum length 61.2 mm. Supinator and interosseous crests partially preserved. [Conjoins with 43, 44(?), 45 (?), 46, 59]
NN 43 [‡]	Ulna, right Not Neandertal 1	Shaft fragment, maximum length 56.2 mm. Preserves base of coronoid process. [Conjoins with 42, 44 (?), 45 (?), 46, 59]
NN 44 [‡]	Ulna, right Not Neandertal 1	Small portion of articular surface. Found associated with, but not connected to, 43. Possibly conjoins with other right ulnar pieces.
NN 45 [‡]	Ulna, right Not Neandertal 1	Small angled piece of coronoid and radial articular surfaces. Found associated with, but not connected to, 43. Possibly conjoins with other right ulnar pieces.
NN 46 [‡]	Ulna, right Not Neandertal 1	Fragment of shaft (35.3 mm maximum length) with nutrient foramen. Conjoins with 42, 43, 44 (?), 45 (?), 59]
NN 47*	Humerus, right Not Neandertal 1	Mid-shaft splinter. Maximum dimensions 55.4 (Proximal--distal) × 12 mm. [Conjoins with 1, 2, 3]
NN 48	Tibia, right	Anterior shaft fragment. Maximum length (proximal--distal) 45.7 mm. [Conjoins with 5]
NN 49	Rib fragment	Uncertain side. Midshaft, below angle. Maximum length 35.2 mm.
NN 50 [§]	Maxillary molar, right Not Neandertal 1	Deciduous dm ² crown with heavy occlusal and interproximal wear. Resorbed roots.
NN 51	Premolar, right	Permanent P ⁴ . Heavy occlusal and interproximal wear.
NN 52	Mandible	Basilar portion of symphysis with digastric fossa and genial crest. Maximum length (coronal plane) 37.8 mm.
NN 53	Tubular bone splinter	Unknown element. Maximum dimensions 42.4 mm (proximal--

No.	Element	Description
NN 54	Not human	distal) × 8.7 mm.
NN 55	Mandibular incisor, left	Permanent I ₁ . Heavy occlusal and interproximal wear.
NN 56	Sphenoid	Segment of scaphoid fossa. Maximum dimensions 18.2 mm × 13.8 mm.
NN 57	Manual phalanx.	Left ray 2 (?), intermediate row. Arthritic proximal articular surface.
NN 58	Metacarpal IV	Proximal shaft, 32.1 mm in length. Left (?).
NN 59 [‡]	Ulnar shaft, right. Not Neandertal.	Distal shaft with interosseous crest. Maximum length 82.7 mm. [Conjoins with 42, 43, 44 (?), 45 (?), 46]. Fracture callus on distal end.
NN 60 [¶]	Ulna, left Not Neandertal 1	Proximal end with olecranon and coronoid processes. Adult. Maximum proximal-distal length 47.2 mm.
NN 61	Mandible	Fragment of left mandible at condylar neck. Maximum dimensions 26.3 × 16.4 mm.
NN 62	Not human	
NN 63	Not human	
NN 64	Rib II, left	89.6 mm long segment preserving neck, tubercle, and shaft to position where <i>M. serratus anterior</i> attachment would have been.

*Neandertal 1 preserves this portion of its right humerus. Specimen is slightly more gracile and smaller than Neandertal 1, but well-developed pectoralis major attachments suggest an adult. Platymeric shaft, relatively narrow deltoid tuberosity, and marked myologia pectoralis major attachment, and course of deltoid tuberosity relatively parallel to shaft long axis suggest a Neandertal. NN 24 may be the same individual but does not connect to the other pieces.

[†]This element is missing on Neandertal 1, and NN 14 is very similar to the preserved left ischial portion of Neandertal 1 in both size and morphology.

[‡]Neandertal 1 preserves a right ulna. This specimen must be from another adult individual.

[§]This deciduous molar is highly unlikely to be derived from an adult individual. Thus it cannot derive from Neandertal 1 and probably is not associated with other adult(s) at the site. Evidence of an adolescent individual in the sample.

[¶]Definite adult; cannot be from Neandertal 1, which possesses a left ulna. Relative equal projection of coronoid and olecranon processes yields a forward-facing semilunar notch, suggesting a Neandertal.
