

Supplementary Table 1. Reproducibility. Overview of all array experiments described in the paper providing standard deviations and relative numbers of usable features, indicating the reproducibility of noise and quality of the oligonucleotide array CGH platform. *Test sample*: name of the sample used in the test channel, *Ref. sample*: indicating the DNA used in the reference channel, *Tissue*: indicating the tissue type of the sample, *Type*: indicating whether the DNA was isolated from fresh or frozen tissue or from a formalin fixed paraffin embedded (FFPE) archival source, *Batch*: arbitrary batch number indicating whether arrays are from the same or different print batches, *Array elements*: indicating the number, species and type (BACs or oligonucleotides) of array elements used, *Remarks*: indicating conditions different from the described methods, *St. deviation*: the standard deviation of the log2ratio's in an area without chromosomal aberrations as determined by the smoothing algorithm(14), *Area for Stdev*: chromosomal area used to calculate the standard deviation, *% Features*: relative number of features that passed quality control, *Figure nr*: indicating the Figure numbers in which data from this experiment are displayed, *GEO acc. nr.*: indicating the accession number in the Gene Expression Omnibus database (www.ncbi.nlm.nih.gov/projects/geo) from which experimental data are available.
