

NEW TYPE OF CONNECTOR PLUGS AND SOCKETS

A new type of connector plug and/or socket, the Amphenol Blue-Ribbin connector, has been found superior to the Amphenol or Cannon type AN connectors. Its advantages lie in ease of connecting, larger contact-surface area, and easier soldering (and re-soldering!). It can be obtained with keyed latch shells which lock one connector into another with a single snap action instead of the elaborate "fixed-ratio screwing" necessary with the AN connectors. Any large electronic-components retailer will supply this unit.
