

Supplementary Figure S1

A

B

Supplementary Figure S1. Depletion of PABP by siRNA. (A) PABP regions targeted by three independent of siRNAs. (B) HeLa cells were transfected with control siRNA (siPABP#2 INV) or PABP siRNAs (siPABP#1 or siPABP#2). Cells were harvested 72h later, and extracts were subjected to Western blot analysis with anti-PABP antibody. As a loading control, blots were probed with anti- β -Actin antibody. Data are expressed as the percentage of PABP amount relative to that detected that in control siRNA-transfected cells (set at 100%). The results are representative of three independent experiments.
