

Supplementary Figure 1. Primary human hepatocytes were cultured on collagen-coated glass slides, treated by 10 μ M ALLN and 10 mM 3-MA for 12 h, and labeled for ApoB (red) and neutral lipids (green). The hepatocyte showed ApoB-crescents (arrows) that appeared to be identical to those found in Huh7 and HepG2 cells, but their frequency was low. Bar, 10 μ m.
