

LC3-positive autophagosomes

Supplementary Figure 6. The LC3 labeling started to increase as early as 1 h after ALLN was given. The number of LC3-positive particles per cell was quantitated in Huh7 cells treated with 10 μ M ALLN for 0 h, 1 h, 12 h, or with 10 μ M ALLN and 10 mM 3-MA for 12 h. Results of three independent experiments were averaged, and statistical significance was examined using Student's *t*-test. ($n = 3$; $*p < 0.01$)
