

ELECTRONIC APPENDIX

This is the Electronic Appendix to the article

Farm Scale Evaluations of spring-sown genetically modified herbicide-tolerant crops: a statistical assessment

by

Suzanne J. Clark, Peter Rothery and Joe N. Perry

Proc. R. Soc. B ([doi:10.1098/rspb.2005.3282](https://doi.org/10.1098/rspb.2005.3282))

Electronic appendices are refereed with the text; however, no attempt is made to impose a uniform editorial style on the electronic appendices.

Table A1. Glossary of statistical terms, grouped according to type and approximately in the order they appear in the text.

term	definition
n_0	Originally planned sample size.
n	Realized sample size, i.e. number of replicate fields per treatment after exclusion of fields with any missing values or total counts of zero or one.
CV	Coefficient of variation, i.e. ratio of standard deviation to mean, expressed as a percentage.
M	Geometric mean of whole-field counts.
s	Standard deviation of half-field units, calculated as the square-root of the residual mean square from a randomized block ANOVA of the $2n$ half-field units transformed to natural logarithms.
V	Variance of a population of counts.
μ	Mean of a population of counts.
α	Parameter of Taylor's power law, $V = \alpha \mu^\beta$.
β	Exponent of Taylor's power law, $V = \alpha \mu^\beta$.
R	Multiplicative treatment difference.
d	Mean of the n differences between half-field counts for each treatment on the logarithmic scale. Test-statistic for H_0 and estimate of treatment effect on a logarithmic scale used for reporting results of FSE (corresponds to a variance-mean relationship with $\beta = 2$). R is estimated as 10^d .
r	Logarithm of the ratio of the arithmetic means for each treatment. Test-statistic for H_0 and estimate of treatment effect on a logarithmic scale (corresponds to a variance-mean relationship with $\beta = 1$).

d_w	Weighted version of d , with weights based on approximate variance of the difference in logarithmically-transformed counts. Test-statistic for H_0 (corresponds to a variance-mean relationship with $\beta = 1.5$).
$r_{1.5}$	Estimated treatment effect on a logarithmic scale based on a Generalized Linear Model with logarithmic link and variance function $V = \alpha \mu^{1.5}$ (corresponds to a variance-mean relationship with $\beta = 1.5$).
p	Observed probability level for the test of the null hypothesis based on a Monte Carlo paired randomization test, using the test-statistic d .
b	The regression coefficient obtained from a linear regression of logarithmically-transformed absolute standardized residuals on logarithmically-transformed fitted values, for any one of the three variance-mean models defined by $\beta = 1, 1.5$ or 2 .
β_{est}	Estimate of the true value of β , calculated as $\beta_{est} = 2b + \beta$, obtained for any one of the three variance-mean models defined by $\beta = 1, 1.5$ or 2 .
β_0	Combined estimate of the true value of β obtained from the three separate β_{est} values. Calculated as $-A/D$, where A and D are the intercept and regression coefficient, respectively, from a linear regression of the three values of $(\beta_{est} - \beta)/2$ on the three values of β .
θ	Estimate of non-centrality parameter, calculated as $\ln(R)/\sqrt{2s^2/n}$.
n_p	Projected sample sizes, in various multiples, k , of n , for which power of the d -statistic was estimated.
n_{80}	Sample size required for 80% power for any given value of R .
N	Total number of analyses of count indicators assessed.
$N_{1.5}$	Number of those N analyses with estimated $R > 1.5$ or estimated

$R < 0.67$.

$P_{1.5}$ Proportion of the $N_{1.5}$ analyses that achieved significance at the 5% level.

Table A2. Values of β_0 (estimate of the exponent in the power-law relationship between variance and mean abundance, $V = \alpha\mu^{\beta_0}$), n (number of fields), CV (coefficient of variation), s (natural logarithmic scale) and M (whole-field geometric mean) for analyses of count indicators grouped according to the primary FSE papers: aerial = Haughton *et al.* (2003), tables 2-7; boundary = Roy *et al.* (2003), tables 6-9; surface = Brooks *et al.* (2003), tables 1-4 & 6; trophic = Hawes *et al.* (2003), tables 4-7; vegetation = Heard *et al.* (2003), tables 2, 4 & 5 (year t only). Crops: b = beet; m = maize; s = spring oilseed rape. Pollinators = bees and butterflies.

Legend to Figure A1

Figure A1. Proportion of analyses with 80% power given estimated initial sample sizes (n , number of fields), for six values of the multiplicative treatment effect, $R = 1.1$ (x), 1.2 (●), 1.3 (+), 1.4 (*), 1.5 (■) and 2 (◆), based on analyses of 531 FSE count indicators (see table A2).
