

SUPPLEMENTARY FIGURE 2

Actin bodies contain stable actin filaments.

Actin bodies are resistant to Latrunculin A (A). Wild type cells were grown at 30°C in YPDA medium. During exponential growth (top panel), after 3 days or 7 days of culture (bottom panel), cells were incubated 5 min or 2 h with either 200 μ M of Lat-A or DMSO as a control. Cells were then fixed and stained with Alexa-phalloidin. For each time point, cells with polarized actin cytoskeleton (green bar), depolarized actin cytoskeleton (yellow bar) or actin bodies (red bar) were counted ($n > 200$).
