

ESM4

Results of the full ANOVAs (6 factors without interaction) with or without family effects for nuclear gene total nucleotide diversity (π_{total}), silent site nucleotide diversity (π_{silent}), and haplotype diversity. For clarity, results are split by factors than by the three analysed variables. Least squares means are given for the ANOVA that includes the plant family effects. $n = 103$.

Factor	Without family effects			With family effects			Least Squares Estimates		
	F	p_value	R ²	F	p_value	R ²			
Mating system	π_{total}	23.28	<0.0001	0.176	8.70	0.004	0.070	0.010	0.005
