

FIG. S3. Liver pathology, low magnification. Liver sections (5 μ m) from control (HBSS) and infected mice were stained with H & E. Representative images (40x) of control liver tissue from mice injected with HBSS (panel O) or livers infected by the designated strains of *Y. pseudotuberculosis* (panels A-N) are shown. Arrows indicate the presence of microabscesses (panels A-E, G-I, N) and/or necrotic lesions (panel J). All experiments were repeated 3 times; data shown are from one representative experiment.
