quantitative multiplex PCR analysis in families 73 and 94. Individuals A52 and B60 have an abnormal pattern (up): A52 have approximately double dose for exon 12 and B60 have half of the dose for exon 12 comparing with the control. The experiment was run with two replicas including all the members of family 73 and B60 from family 94, and the results were confirmed (bottom). The double dose for exon 12 is observed in

A50 (father), A52 (proband) and A55 (brother) (in bold). The segregation in family 94 could not be performed because there was no DNA of other members.
