

Supplementary Figure 4. *Distribution of LC3 in wildtype and lamp1^{-/-}/lamp2^{-/-} cells following phagocytosis.* Wildtype (A) and lamp1^{-/-}/lamp2^{-/-} (B-C) fibroblasts were co-transfected with cDNA encoding FcγIIA receptors and GFP-LC3. After 24 h, transfected cells were exposed to IgG-opsonized beads and maturation was allowed to proceed for 5 min (A-B) or 60 min (C). Open arrows point to phagosomes negative for LC3 at the indicated time. Size bar represents 10 μm.
