

These are electronic appendices to the Biology Letter by Nudds *et al.* 2004 Forelimb proportions and the evolutionary radiation in Neornithes. *Proc. R. Soc. Lond. B* (Suppl.) **271**, S324–S327. (DOI 10.1098/rsbl.2004.0167.)

Electronic appendices are refereed with the text. However, no attempt has been made to impose a uniform editorial style on the electronic appendices.

## ELECTRONIC APPENDICES

### Electronic Appendix A

Table 1. List of species and data used in the analyses.

Species	n	BI	s.d.
<i>Acanthis cannabina</i>	2	0.81	0.06
<i>Acanthisitta chloris</i>	1	0.73	
<i>Accipiter cooperii</i>	1	0.93	
<i>Accipiter gentilis</i>	6	0.89	0.04
<i>Accipiter nisus</i>	7	0.83	0.04
<i>Aceros plicatus</i>	1	0.65	
<i>Aceros undulatus</i>	1	0.65	
<i>Acridotheres tristis</i>	1	0.88	
<i>Acrocephalus schoenobaenus</i>	2	0.84	0.04
<i>Acrocephalus scirpaceus</i>	1	0.71	
<i>Acryllium vulturinum</i>	1	0.99	
<i>Actophilornis africana</i>	2	0.90	0.05
<i>Actophilornis albinucha</i>	1	0.92	
<i>Aechmophorus occidentalis</i>	3	1.13	0.03
<i>Aegialornis gallicus</i>	1	0.74	
<i>Aegithalos caudatus</i>	2	0.79	0.01
<i>Aegolius acadicus</i>	1	0.90	
<i>Aegolius funereus</i>	1	0.89	
<i>Aegypius monachus</i>	4	0.78	0.03
<i>Aegypius tracheliotus</i>	2	0.73	0.02
<i>Aenigmavis sapea</i>	1	1.21	
<i>Aethia cristatella</i>	2	1.35	0.32
<i>Aethia pusilla</i>	1	1.20	
<i>Aethia pygmaea</i>	1	1.20	
<i>Afropavo congensis</i>	1	0.97	
<i>Agapornis fischeri</i>	1	0.85	
<i>Agapornis personata</i>	2	0.84	0.01
<i>Agapornis pullaria</i>	1	0.82	
<i>Agapornis roseicollis</i>	1	0.86	
<i>Agelaius phoeniceus</i>	1	0.87	
<i>Agriocharis ocellata</i>	4	1.09	0.05

<i>Aix galericulata</i>	2	1.18	0.03
<i>Aix sponsa</i>	3	1.21	0.09
<i>Ajaia ajaja</i>	3	0.88	0.03
<i>Alauda arvensis</i>	3	0.82	0.04
<i>Alca torda</i>	10	1.29	0.12
<i>Alcedo atthis</i>	5	0.84	0.04
<i>Alcedo leucogaster</i>	1	0.83	
<i>Alectoris barbara</i>	2	1.04	0.06
<i>Alectoris graeca</i>	3	1.07	0.05
<i>Alectoris rufa</i>	3	1.07	0.02
<i>Alectura lathami</i>	1	0.97	
<i>Alisterus scapularis</i>	2	0.86	0.02
<i>Alle alle</i>	9	1.23	0.07
<i>Alopochen aegyptiacus</i>	2	1.07	0.04
<i>Amandava amandava</i>	1	0.93	
<i>Amazilia sp.</i>	2	0.92	0.12
<i>Amazona aestiva</i>	1	0.83	
<i>Amazona albifrons</i>	1	0.81	
<i>Amazona amazonica</i>	1	0.85	
<i>Amazona autumnalis</i>	1	0.83	
<i>Amazona brasiliensis</i>	1	0.85	
<i>Amazona farinosa</i>	4	0.87	0.03
<i>Amazona festiva</i>	1	0.86	
<i>Amazona leucocephala</i>	2	0.85	0.01
<i>Amazona ochrocephala</i>	1	0.84	
<i>Amazona pretrei</i>	1	0.84	
<i>Amazona ventralis</i>	1	0.85	
<i>Amazona versicolor</i>	1	0.81	
<i>Amazonetta brasiliensis</i>	2	1.14	0.01
<i>Ammoperdix griseogularis</i>	1	1.01	
<i>Anadorhynchus hyacinthinus</i>	2	0.75	0.01
<i>Anas acuta</i>	3	1.13	0.02
<i>Anas americana</i>	1	1.13	
<i>Anas angustirostris</i>	1	1.15	
<i>Anas aucklandica</i>	4	1.31	0.08
<i>Anas bahamensis</i>	2	1.12	0.01
<i>Anas castanea</i>	3	1.15	0.01
<i>Anas chlorotis</i>	2	1.22	0.01
<i>Anas clypeata</i>	4	1.17	0.09
<i>Anas crecca</i>	3	1.22	0.10
<i>Anas cyanoptera</i>	1	1.20	
<i>Anas discors</i>	1	1.16	
<i>Anas falcata</i>	1	1.16	
<i>Anas flavirostris</i>	1	1.13	
<i>Anas georgica</i>	1	1.16	
<i>Anas gibberifrons</i>	2	1.14	0.01
<i>Anas laysanensis</i>	2	1.15	0.01
<i>Anas leucophrys</i>	2	1.17	0.05
<i>Anas oustaleti</i>	2	1.16	0.02
<i>Anas penelope</i>	3	1.18	0.04

<i>Anas platalea</i>	1	1.15	
<i>Anas platyrhynchos</i>	11	1.21	0.06
<i>Anas poecilorhyncha</i>	2	1.15	0.01
<i>Anas querquedula</i>	2	1.22	0.12
<i>Anas rubripes</i>	4	1.21	0.05
<i>Anas sibilatrix</i>	1	1.13	
<i>Anas specularis</i>	1	1.22	
<i>Anas strepera</i>	2	1.20	0.06
<i>Anas superciliosa</i>	1	1.17	
<i>Anas undulata</i>	2	1.15	0.02
<i>Anas versicolor</i>	1	1.16	
<i>Anas wyvilliana</i>	2	1.15	0.01
<i>Anastomus lamelligerus</i>	1	0.84	
<i>Anastomus oscitans</i>	1	0.78	
<i>Anhima cornuta</i>	3	0.94	0.06
<i>Anhinga anhinga</i>	7	1.11	0.04
<i>Anhinga rufa</i>	1	1.11	
<i>Anneavis annae</i>	2	1.09	0.05
<i>Anodorhynchus glaucus</i>	1	0.82	
<i>Anous stolidus</i>	3	0.86	0.01
<i>Anser albifrons</i>	3	1.05	0.03
<i>Anser anser</i>	3	1.05	0.01
<i>Anser caerulescens</i>	2	1.03	0.05
<i>Anser canagicus</i>	1	1.02	
<i>Anser cygnoides</i>	1	1.05	
<i>Anser erythropus</i>	2	1.07	0.05
<i>Anser fabalis</i>	6	1.05	0.04
<i>Anser indicus</i>	1	1.03	
<i>Anser rossii</i>	1	1.01	
<i>Anseranas semipalmata</i>	2	1.02	0.02
<i>Anthracoceros malabaricus</i>	1	0.71	
<i>Anthracothorax nigricollis</i>	1	1.00	
<i>Anthropoides paradisea</i>	2	0.88	0.07

## **Electronic Appendix B**

### ***BI and the phylogeny of modern birds***

In figure 1, mean BI is plotted onto the ordinal-level phylogeny presented by Sibley and Ahlquist (1990). At this level, and assuming the approximate validity of the results presented by these workers, values of BI of less than 1 occur within the clade comprising the Piciformes and higher terminals (i.e. Passeriformes). The distribution of the values of BI within this part of the cladogram suggests a correlated reduction in the relative length of the humerus and increase in the relative length of the ulna throughout the evolution of these "higher" clades. This trend towards reduction of the humerus culminates in orders like the swifts (Apodiformes) and hummingbirds (Trochiliformes) where the length of this element is extremely abbreviated.

Interestingly, observed values of BI within the two orders Tinamiformes and Turniciformes and in the Cracidae (Craciformes) cluster close to 1 (figure 1): these relatively primitive groups have long proved difficult to classify. Within most of the other avian orders, with few exceptions (see below), the BI remains consistently greater than or less than 1 and a narrow range of values are seen within these clades. Groups in which BI is > 1 include the clades Struthioniformes, Galliformes, Anseriformes, Coliiformes, Cuculiformes, and Musophagiformes. Overall, most of the species that have particularly high values of BI are those that have relatively low wing area. A reduction in feather area can be achieved by a shortening of the ulna, which will determine the extent of the secondary feather area available for flight (Rayner 1988). Groups in which BI is < 1 are the Craciformes (Megapodiidae), Piciformes, Galbuliformes, Bucerotiformes, Upupiformes, Trogoniformes, Coraciiformes, Psittaciformes, Apodiformes, Trochiliformes, Strigiformes, Columbiformes and Passeriformes.

Observed stability of the brachial index to the phylogenetic topology of Sibley and Ahlquist (1990) is remarkable, but there are a number of exceptions at this level, most notably the average values for the Coliiformes, Cuculiformes, Gruiformes and Ciconiiformes. The phylogenetic positions of these orders, however, are controversial. The clades "Gruiformes" (figure 3a) and "Ciconiiformes" (figure 3b) of Sibley and Ahlquist (1990) correspond to large and complex groups, which other authors (Wetmore 1960; Gruson 1976; Cracraft *et al.* In press) have considered substantially different in composition. Members of the groupings Gruiformes and Ciconiiformes (Sibley & Ahlquist 1990) are varied in their wing proportions. Within the Gruiformes four clades have values of BI > 1: the Rallidae ( $1.19 \pm 0.12$ , species n = 25), Cariamidae ( $1.09 \pm 0.06$ , species n = 2),

Psophiidae ( $1.07 \pm 0.02$ , species n = 2), and Heliornithidae ( $1.15 \pm 0.12$ , species n = 2). However, although the Rallidae were considered the most basal clade within Gruiformes by Sibley and Ahlquist (1990), this conclusion is controversial. On the basis of a cladistic analysis of morphological characters, Livezey (1998) hypothesised that the Rallidae are derived within the order, and that clades with BI < 1 such as Turnicidae (mean BI =  $0.99 \pm 0.05$ , species n = 7) and Otidae (mean BI =  $0.91 \pm 0.04$ , species n = 10) represent the most basal divergences. Indeed, the remaining families within this group are consistent with the reported trend in that they have BI values of > 1.

Within Sibley and Ahlquist's (1990) large order Ciconiiformes, a few anomalous clades are characterised by BI > 1: Procellariidae ( $1.05 \pm 0.07$ , n = 35), Gaviidae ( $1.25 \pm 0.05$ , n = 6), Spheniscidae ( $1.37 \pm 0.10$ , n = 18), Sulidae ( $1.02 \pm 0.15$ , n = 14) Anhingidae ( $1.11 \pm 0.04$ , n = 2) and Podicipedidae ( $1.12 \pm 0.07$ , n = 12). The Laridae also exhibit a BI > 1 ( $1.15 \pm 0.38$ , n = 54), which is explained by the inclusion of underwater swimmers such as the auks and guillemots (the Alcidae, *sensu* Wetmore (1960)), that without exception have BI values > 1.1. The more aerial species within the Laridae (terns and gulls) exhibit BI < 1. Once again BI values of < 1 appear to be primitive for Ciconiiformes: all of the basal lineages within Ciconiiformes (the clades including the Falconidae and Pteroclidae) have BI's < 1.

BI distribution among the phylogeny of Cracraft et al (In press) is similar to that found for Sibley and Ahlquist's phylogeny. Paleognaths and the Galloanserae are characterised by BI > 1, and higher clades by BI < 1. Clades exhibiting BI > 1 are identical to those discussed above with reference to the hypothesis of Sibley and Ahlquist (1990), but a lack of resolution amongst the 'higher' land-bird clades (a polytomy) precludes a detailed discussion of BI distribution across the phylogeny.

Although our analyses have demonstrated the presence of a remarkably stable fit between BI and phylogeny, there are a number of exceptions to this trend. All of these exceptions, however, occur within clades characterised by mean values of the BI that do fit within the overall trend (i.e., within a clade that is overall consistent with reported trends). Further investigation shows that exceptions are either secondarily flightless (or near flightless) birds that have evolved to use their wings to swim underwater, or are taxa that have unusual ecologies (when compared to other members of the same clade) (Rayner & Dyke 2002).
